THE Barmouth Urban Council have been negotiating with an electric-lighting company. The offer of the company was that the town should provide the money and they would undertake to carry the project through and to maintain the same, subject to the option of transfer on certain terms, and in the course of about twenty-five years the company would hand it over to the Council. At the last meeting a letter was read from the company to the effect that they had gathered from a report of the previous

meeting that the Council had reconsidered their position, and as the scheme was a small one and they had considerable work in hand they withdrew their offer.

THE Leith tramways committee recently considered tenders for the thirty-seven cars to be required when the system is converted to one of electricity. Thirty are to be of the ordinary double-decked type, and seven of the double-decked type with covered tops. Complete offers for cars, trucks and equipment were made by six firms—five English and one Scottish—and the competition was very keen, one firm making four and another two offers. The highest tender was 20,087*l.* 12*s.* and the lowest 18,863*l.* The offer by the Brush Electrical Engineering Company, Ltd., Loughborough, has been accepted, who offered to supply the cars, trucks and equipment for 19,228*l.* The thirty cars without the top cover are priced at 15,000*l.*, and the seven with the top cover at 4,228*l.* The cars can be delivered in about sixteen weeks.

THE Sunderland District Electric Tramways, Limited, have arranged a contract for the supply of power to the important collieries in the county of Durham belonging to the Lambton Collieries, Limited. It is proposed to use the power for hauling, pumping, coal-cutting, lighting and winding purposes, as well as for the engine works at Philadelphia, which will make these collieries one of the most up-to-date groups in the country. These collieries employ over 10,000 men, and have an output of over three million tons per annum. A large central power station is to be at once erected on five acres of land at Philadelphia, from which the power will be taken to the collieries, and in addition the tramways, of which over twelve miles are fully completed, will be supplied with the necessary power, as well as the supply of power for electric lighting in the urban districts of Houghton-le-Spring and Heiton-le-Hole and the rural district of Essington, over which the company has statutory lighting powers.

OWING to the vast amount of detail to be dealt with it has been found necessary to postpone for another year the promotion of the Bill for the proposed extensive docks at Harwich.

THE general purposes committee of the Burnley Corporation decided on Monday to recommend the Town Council to appoint Mr. Peregrine Thomas, of Leigh, as town clerk. Mr. Thomas has been town clerk of Leigh since 1897, and before that he was clerk to the Milford Haven Urban District Council.

Two steeplejacks were repairing a chimney at Blantyre when one, overcome by the fumes, became unconscious. His mate, who was sitting astride of the chimney, which is 60 feet high, grasped him as he was falling, and held him—a man of 14 or 15 stone—suspended in mid-air for an hour and a half until help came.

THE Secretary of State for India has sanctioned the construction of three new huge canals in the Punjab—one on the Upper Jhelum, another on the Upper Chenab and the third in the Lower Doab. The estimated cost of the undertaking is 782 lakhs of rupees. The total length of the three canals will be 2,714 miles.

THE Essex County education committee have decided to grant 5,000*l.* towards the cost of a new secondary school at Brentwood, 2,250*l.* towards a similar new school at Braintree, 5,000*l.* towards the cost of extensions at the Ilford secondary school, and 4,000*l.* for enlargements at Palmer's endowed school, Grays.

THE London County Council have completed during the current financial year dwellings providing for the accommodation of 6,486 persons. Schemes in progress in regard to the clearance of insanitary areas involve the displacement of 4,794 persons and the provision of dwellings for 5,324 people. The estimated net cost of the various clearance schemes in question is 524,000*l.*

MR. JAMES WILLIAMS, of 11 Carteret Street, Queen Anne's Gate, S.W., has taken into partnership Mr. Edmund L. Wratten, A.R.I.B.A., and the name of the firm will in future be Messrs. Williams & Wratten. Mr. James Williams was formerly partner of the late Mr. George Devey, of Bond Street, W., afterwards carrying on his practice in Victoria Street, Westminster, moving from there to his present address, where he has been for some years past.

A NEW bridge over the river Earn at Comrie, erected by the Perth County Council, has been formally opened. The bridge was tested by driving over it a traction engine with five waggons laden with road metal, a weight of 40 tons. The construction of the bridge has been expeditiously carried out by the contractors, Sir William Arrol & Co., Glasgow. The cost of the bridge has been about 4,500*l.*

THE Glamorgan county surveyor has reported that the damage to main roads by locomotive traffic was still on the increase, and that last year it had necessitated an increased expenditure of about 2,313*l.* Should the traffic further increase, he advises the conversion of the limestone roads into granite roads. He has already provided in his draft annual estimate for the conversion of sections of four roads which were suffering from excessive ordinary haulage.

At Chester a school of girls has taken up its quarters in the county stand on the racecourse, premises in Chester having been searched for in vain. The education committee prevailed on the Race Company to allow the temporary use of the stand, which makes an admirable schoolroom, at a rental of 150*l.* per annum. His Majesty's inspector approves of the location, and the title of the City and County Girls' school has been given to it.

THE Staffordshire education committee having received a letter from the county medical officer suggesting the consideration of the whole question of school construction, it was resolved that a sub-committee should meet at the first available opportunity to consider the question with Dr. Reid. The chairman was to confer with the clerk of the County Council as to the advisability of publishing lists of the tenders received for building works, &c., and to report.

THE bridges committee of the London County Council reported to the meeting on Tuesday that the progress made by the contractor in the work of the erection of the superstructure of Vauxhall Bridge was very unsatisfactory. Under the terms of the contract it should be completed by December 31, 1905, but having regard to the progress already made it was not probable that it would be completed by the specified time. Everything possible is being done to make the contractor hasten on with the work.

THE chairmen of committees of Lords and Commons announced, with reference to the intimation of the Board of Trade that the London Tube schemes would not be taken until the report of the London Traffic Commission was presented to Parliament, that they did not feel inclined to decide what would be done with those schemes until Parliament had had an opportunity of considering the report. The London Traffic Commissioners will meet on Thursday, February 2, further to consider their report, but it is not anticipated that that report will be placed in the hands of the Government before the end of March.

THREE depôts owned recently by the Bury, Rochdale and Oldham Tramway Company, and which under the terms of purchase passed into the possession of the local authorities, were sold by auction in Manchester on Tuesday. The first lot offered was the Rochdale depôt, with the land—containing 7,239 4-9 square yards—buildings and two dwelling-houses, which was sold for 400*l.* The ground-rent is 101*l.* 3*s.* 4*d.* The second lot was the Bury depôt, including 3,600 square yards of land and the tramway buildings. The ground-rent is 150*l.* and the lease for 983 years from 1898. Eventually the property was knocked down for 50*l.* The Royton depôt, including 5,057 square yards and the buildings—ground-rent 42*l.* 4*s.* 6*d.*—was sold for 130*l.*

THE works committee of the London County Council have submitted a statement of the work carried out by the works department for the half-year ended September 30, 1904. Statement I dealt with eleven completed works in

respect of which complete specifications and bills of quantities had been prepared. The final certificate for the works was 98,062*l.* 16*s.* 10*d.*, and the actual cost was 87,388*l.*, or 10,674*l.* 3*s.* 3*d.* below the cost of the final estimate. Statement II. showed that work of the value of 1,076*l.* 2*s.* 4*d.* had been carried out on the basis of actual cost; and Statement III. showed that jobbing works of the schedule value of 23,986*l.* 10*s.* 7*d.* had been carried out at a cost below schedule value of 2,951*l.* 12*s.* 7*d.*

THE Birmingham city surveyor has made the following returns concerning the extra work involved in coping with a snow fall:—The total number of men engaged in clearing away the snow which fell during last week's storm was 720 (including 180 extra hands), and they had the assistance of 170 horses and carts belonging to the Corporation, and also fifty-six extra horses and carts. In addition, there were twenty sweeping machines, twenty-seven scraping machines and three snow ploughs engaged. Altogether there were 6,850 loads of snow removed, and taking the weight of each load at 1 ton 10 cwt., the total weight of snow cleared from the streets of the city was estimated at over 10,000 tons.

THE Kent and Essex Brickmasters' Association and other Thames and Medway barge owners' societies, at a meeting last week, passed the following resolution:—"That the meeting most strongly protests against any attempt to impose tonnage dues on vessels not exceeding 45 tons, as being injurious to owners of small craft, a tax on commerce and detrimental to the true interests of the Port of London; that owners of sailing barges should have direct representation on any board or commission appointed for the administration of the port; that the present system of compulsory pilotage should be abolished; and that a committee be appointed to watch the interests of sailing barge owners."

VIENNA at the present time covers a superficial area of 44,530 acres, or some 25,000 more than Paris, and as large as Paris, Berlin and Dresden taken together. This will be increased by the incorporation of certain districts situated on the left bank of the Danube. A port for the projected canals from the Danube to the Elbe and from the Danube to the Oder is to be constructed there, and the city desires to profit by the increased value which the district is certain to acquire therefrom.

AN APPRECIATION.

On Monday evening last, January 23, an interesting little gathering took place at Simpson's in the Poultry. Under the genial presidency of Mr. Ellice-Clark, the chairman of Messrs. Hobbs, Hart & Co., Ltd., the well-known safe and lock makers, the staff met to celebrate the appointment of Mr. Chas. Lee as managing director of the company. Mr. Ellice-Clark was supported by his fellow directors, and testified in a particularly kindly little speech to the appreciation of Mr. Chas. Lee's valuable services to the company, and to the pleasure with which the directors had called him from the position of manager and secretary to the highest post which they could confer, that of a seat at the board, and the position of managing director. Mr. Lee, in responding, gave a most interesting account of the firm's rise, of its uphill work, and its important position at the present day amongst the leading firms of the safe and lock trades, showing that without any special influence at his back he had been able to progress with the firm until he had arrived at the "proudest and happiest day of his life," the recognition of his services by this appointment of the directors. We should like particularly to call the attention of those working, whether in offices or in works, to one of the reasons given by Mr. Lee for possible appreciation by his employers, and that was that he "never looked at the clock;" if work had to be done he did it. Mr. Lee testified ungrudgingly in his speech to the general ability and thoroughness of the work done by

the staff in general. Mr. Pullman, who now becomes manager in consequence of Mr. Lee's appointment, in the course of the evening had the pleasing task of making a presentation from the staff to the new managing director, as a small memento of (as he put it) the affectionate respect and regard which his subordinates in the employ of the company had always entertained for their chief, and the pleasure with which they had seen the appreciation of the directors. The remaining part of the evening was devoted to music both vocal and instrumental. The firm have a staff who can work well, and on Monday night they proved they could both sing and enjoy themselves equally well.

WILLIAM BIRCH, LTD.

THIS firm, which is one of very old standing in the trade, was, as we recently announced, awarded at the St. Louis Exhibition both the Grand Prize and Gold Medal for the excellent design and workmanship appertaining to their fine display of furniture and cabinetwork, that formed a centre of great attraction and interest.

The bulk of the work, which embraces all kinds of furniture, is produced at their two extensive and well-equipped factories in High Wycombe, while the vast show-rooms situated at 370 Euston Road, N.W., are replete with the varied specimens of their manufacture, and there are upholstery workshops in addition contiguous. A stroll through these show-rooms forms an instructive object-lesson, as ample evidence is afforded that there are no signs of decadence in furniture manufacture, but, on the contrary, that a very earnest effort is being made to enhance, if possible, the high reputation appertaining to the elder days of art, and in this connection the firm in question occupy a unique position; inasmuch as they are manufacturers for the wholesale trade of practically everything in the way of furniture. One prominent feature is the great number of chairs turned out in wood, cane and rush, for large institutions of all kinds, as well as for libraries, while cabinetwork of every description is also well in evidence. Nor should mention be omitted of the very high-class marqueterie work and fabrics of elegant design and character, including admirably designed tapestries, needlework and appliqué. We also noticed in

A GREEK AMPHITHEATRE OF CONCRETE.*

THE University of California, located at Berkeley, on San Francisco Bay, has the first Greek amphitheatre constructed of permanent material in the United States, and probably the first built anywhere for centuries that so closely conforms to the purpose and design of ancient open-air theatres of Greece. Its erection grew out of the practical need of the university for an assembly place large enough to accommodate the immense gatherings of people at commencement seasons and other public functions of the State institution of learning. Through lack of a more suitable place, the students had for several years been holding their class-day plays and football rallies in a natural amphitheatre discovered by a clever student in a depression surrounded by eucalyptus trees on the campus back of the university buildings. Here it was customary for the spectators to occupy the slope, the performance being carried on upon a comparatively level area at the base. The success of this natural amphitheatre suggested to President Benjamin Ide Wheeler, of the university, the idea of erecting a permanent structure on the same lines.

The present open-air theatre was accordingly designed by the university architect, Professor John Galen Howard. Construction work was begun on February 14, 1903. On May 14 the auditorium was practically completed and the stage had been finished up as high as the stylobate, so that the commencement exercises occurring on that day could be held there, President Roosevelt delivering the principal address before an audience of over 8,000 people. The theatre was finally completed in the latter part of September of the same year, and was dedicated then with a three-days' dramatic festival, one of the plays given being the "Birds" of Aristophanes, the presentation of which was made in the original Greek by student actors. The remarkable success of the amphitheatre, with its picturesque setting in the Berkeley Hills, surrounded by thickly-growing tall eucalyptus trees which tower above the classic walls, together with the mild California climate and rainless summers, make of this structure a useful and unique contribution to public buildings of America.

* From a description in the *Engineering Record* by Mr. C. W. Whitney.

Special interest attaches to the theatre because of its being constructed entirely of concrete and also on account of the methods used in its erection. The building consists of two unconnected parts, the auditorium and the stage, known respectively as the theatron and the logeion of the Greeks.

The former is in the form of a great semicircle, 254 feet 8 inches in diameter, and is composed of two tiers of seats. The lower tier is placed around a central level circle 50 feet 8 inches in diameter, which is 5 feet 5 inches below the stage floor, and at the nearest point is 7 feet from the stage. This circle corresponds to the orchestra of the ancient theatre, and is the part used by the Greeks for the chorus. From this central level rise twelve broad steps, each having a tread of 3 feet and a rise of 5 inches. On these steps 1,600 chairs can be placed. Between this lower tier and the upper sections of seats extends the diazoma, an aisle 9 feet wide, which is on a level with the stage floor and the parodoi (the entrances, one on each side between the stage and the auditorium). Bounding this diazoma on the upper or outer side is a wall 5 feet high and 10 inches thick, in front of which extends a concrete bench, broken at intervals by passageways, that will seat 160 persons. Above the wall rise the main seats of the auditorium, arranged in nineteen rows of steps, each with a 30-inch tread and an 18-inch rise. The seats are divided into ten wedge-shaped sections by aisles leading radially from eleven openings in the wall back of the diazoma. The steps in the aisles are half the size of the main seats, having treads of 15 inches and rises of 9 inches. This upper part of the auditorium ascends more steeply than the lower portion, the angle being 30 degs., so that all spectators can obtain an unobstructed view of the stage. Back of the highest row of seats runs a 2-feet by 10-inch wall, 32 feet 6 inches above the stage, with openings opposite all but the two end aisles. Each end of the auditorium next the paradoi is flanked by a radial retaining wall extending 3 feet above the steps. The retaining walls are 10 inches thick at the top, and step out under the seats in 1-foot ledges to a width of 10 feet at the foundation. The outside surfaces of the walls are smooth and have a slight batter.

The upper portion of the auditorium will seat 4,025 people, and as some 600 chairs can be placed in the

orchestra in addition to the 1,600 on the lower seats, the seating capacity of the entire auditorium is over 6,000. On the stage may be seated nearly 1,000, thus bringing the total seating capacity of the whole amphitheatre up to about 7,500 people. The actual capacity of the structure when crowded even exceeds this.

As already stated, the elevation of the stage floor above the orchestra or central level is 5 feet 5 inches, and is on a plane with the parados or entrances. Connecting these entrances and thus dividing the stage from structural connection with the level circle and the lower tier of seats—those, in fact, unbounded by the retaining wall—is an 18-foot walk sloping from each end to the centre. The stage is 134 feet long, and is bounded on the back and sides by a panelled wall 42 feet high. This enclosing wall, which in ancient times was designed to represent the walls of a palace or temple, is severely Classical in design, and is faced by sixteen fluted columns with Doric capitals supporting a Classic cornice with triglyphs and metopes, enriched by bosses. The end walls terminate in massive pylons. There are five entrances (or exits) to the stage, one at each end and three in the rear, of which the larger and central opening is the "royal door" of the Greeks.

Although in general following the Grecian models, the amphitheatre is built after the original design of the architect. It bears closest resemblance to the Greek theatre at Epidauros, particularly in respect to the difference of slope between the upper and lower tiers of seats. The structure harmonises with the general Classic character of the new buildings designed and now being erected on the campus of the university.

In preparing the hillside for the erection of the amphitheatre it was necessary to excavate about 5,000 cubic yards of soil at a cost of 5,000 dols., this sum including all necessary trimming and sheathing. About three-fourths of the auditorium site had to be excavated. The two ends being beyond the line of emergence, required radial foundation walls. The soil was rather hard, being formed principally of decomposed rock. The steps, after having been cut into the bank, held their shape until the concrete was placed, and sheathing was necessary only on the rises of the steps. Concrete to a thickness of 12 inches was placed on the treads as well as on the rises. The method of truing up

the boxes for the steps consisted in determining the accurate position of the lowest and top steps and laying radially between them 6 by 6 inch stringers 6 to 10 feet apart. The outer corners of the steps were then brought up to the bottoms of the stringers, the vertical sheathing being held in place by vertical cross-pieces nailed to the stringers. This method left no holes in the concrete, and after the work had set the wooden forms could be easily removed.

The task of accurately determining the radial points necessary in cutting the steps out of the soil and afterward in placing the concrete forms and truing up the work, was attended with some difficulties which were surmounted as follows:—Approximately at the central point of the auditorium semicircle there was erected a stout post which extended above the elevation of the upper wall. The post was securely fastened in a vertical position by means of four wire cables extending from its top to four large trees outside of the amphitheatre area. A vertical wire was then stretched from an iron bracket on the top of the pole to a similar bracket at the bottom above the exact centre of the semicircle. By means of turnbuckles in the four stay-wires the pole was then shifted and securely fastened in a position to make the upright wire correspond exactly to the axis of the auditorium. Small blocks were then fastened to the post corresponding to the elevation of each step, and from a hook on each of the blocks was stretched the tape, the centres of the hooks being in alignment with the vertical axis wire. The radial distances being thus ascertained, stakes were driven every 2 feet, the proper elevations being given by levels run from bench marks at the ends of the auditorium. Care was taken to have the tape handled by one man always, in order that the personal equation might be minimised in pulling it. After the concrete work was completed the steps were trued up and found to be within the $\frac{1}{2}$ -inch variation allowed for possible errors.

For the concrete Dyckerhoff Portland cement was used, the specifications calling for the following mixture:—One part cement, two parts sand, one part gravel and four parts of 2-inch sharp blue trap rock. Instead of the two parts of sand and one of gravel there was generally used three parts of river pit sand, which was in every way equal to the specified material.

The concrete was all mixed by hand. On a tight plat-

form of plank is placed a bottomless box, 14 inches deep, which is filled level with the top with rock, gravel and sand in the proportions specified. In this case 2 inches of gravel were placed at the bottom, then 8 inches of rock, 2 inches of gravel and 2 inches of sand. After filling the 14-inch box in this manner, another bottomless box, but 2 inches deep, although of the same length and width as the first, is placed squarely on it and filled to the top with cement. According to the specifications the rock, gravel, sand and cement are then turned over once, and again the reverse way, sufficient water being sprinkled over the mass

wheelbarrows to the place where it was wanted. The stagings were carried on around the semicircle as the work progressed. The concrete was dumped into the seat trenches in 6-inch layers and tamped with square rammers. One wedge-shaped section of seats was completed at a time, the aisle steps being left until the last.

On the portions of the seats on the embankment beyond the line of emergence, radial walls placed on approximately 8-foot centres and varying in thickness from 12 to 24 inches, were constructed as foundations for the seats. The walls were carried down to soil capable of supporting

View of the Amphitheatre during Production of a Play by Aristophanes.

to give the mixture the consistency of thick paste. When thoroughly wet the whole is turned over once more and mixed uniformly.

For the upper tier of seats the wet concrete was hoisted in a 1-yard car on an inclined track placed at about the centre of the seats. The cars were hauled up the track by a cable driven by a small engine. At the lower end the track ran into a pit so that the cars could be easily filled from the ground level. A Fresno scraper was used to haul the concrete into the car. When filled the car was raised to one of two stagings, where the contents were dumped into hoppers, from which the concrete was carried by

a weight of three tons per square foot, the footings stepping out in 6-inch steps. The spaces between, clear to the tops of the walls, were packed solid with soil, and over this inclined surface were laid 4 inches of concrete, then a galvanised No. 10 blanket mesh, and finally another 4-inch layer of concrete, the steps being built on the last. This gave an inclined wall below the steps 8 inches thick at its narrowest point, and strengthened through its centre with the 1-inch mesh. The latter was laid in 3 and 4 feet widths, the strips overlapping and lying perpendicular to the front of the stage.

The only metal used in the auditorium outside of the

STRIPSO

In 7, 14, 28 and 56 lb. kegs.

Quickly and thoroughly removes PAINT, VARNISH, STAINED ENAMEL, RUST or GREASE, however old or thick, without injury to the Wood or Metal, leaving the surface perfectly clean and ready for applying new Paint or Varnish.

Saves more than half the ordinary cost of stripping Paint and Varnish.

C. CHANCELLOR & CO., 13 CLERKENWELL ROAD, LONDON, E.C.

WHAT WE SAY

VELURE

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary—washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer.

Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,

13, CLERKENWELL ROAD, LONDON, E.C.

WORTH

One Gallon will
Cover about 90
Square Yards.

TRYING.

FINISHED LIKE A MIRROR.

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRAN, Yacht Builder.

Northampton, Kirkcubbin, Co. Down, June 24, 1901.

BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.

WHAT CUSTOMERS SAY

H.M. THE KING.

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.

11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.

Meadow Grange, Blean, near Canterbury, Jan. 2, 1904.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST,
HEAT OR DAMP, WITHOUT CRACK OR BLISTER.

mesh consisted of "cut-outs" of No. 30 sheet-steel, which were placed vertically in the steps every 8 to 10 feet. The object of these cut-outs was not to add to the strength, but to allow for any contraction or settling that might take place in the first few weeks after the completion of the work. The steel being very thin would be quickly destroyed, and would serve to break the solid mass of concrete into small sections, thus making it less rigid and allowing for the small settlements that usually take place. This provision was a wise one, as any serious cracks due to settling have been successfully prevented.

The stage was constructed by means of forms, the ornaments being moulded in place. Its floor is 6 inches thick, and the wall rests on a foundation 11 feet 4 inches high. The panels of the wall are from 10 to 18 inches in thickness and are built of solid concrete. For a length of 42 feet in the rear of the central portion the wall is extended back 7 feet, allowing cells $3\frac{1}{2}$ feet wide to be formed within it. The columns are 4 feet in diameter at the base, and taper to 3 feet 4 inches at the top, the central hollow core being 12 inches in diameter.

Sheet-steel cut-outs were also used in the panels of the stage wall, being inserted vertically in two strips 3 feet apart back of each column. Some iron was also used in the wall for reinforcement. In all the cornices 11-lb. scrap rail was laid on 3-foot centres across the wall and covered with expanded metal. The capitals of the columns were also reinforced by two layers of expanded metal. For furnishing additional support to the wall above the central door $\frac{1}{2}$ -inch iron rods placed on 1-foot 6-inch centres were used, having been bent to the general shape of the overhanging part.

All the work on the stage is finished with 1:1 mortar, the coating being $\frac{1}{2}$ inch thick. The concrete in the auditorium lacks this finish, having been merely smoothed off sufficiently for seating purposes, since it is the intention ultimately to cover the entire auditorium with a permanent finish, preferably marble.

For surface drainage purposes the seats, walks, stage floor, &c., are all given a $\frac{1}{4}$ inch to 1 foot slope, the water being collected in 12-inch semi-cylindrical gutters, one extending around the diazoma, another around the orchestra circle, a third along the inclined walk below the stage and a

fourth across the front of the stage. All of these gutters empty into two sumps below the stage, from which the water is led into vitrified sewer pipes and carried off from the ground. The gutters are covered with redwood boards. Ample drainage for the hillside under the concrete structure is provided in the shape of four lines of tile which empty into the campus sewer system. Two of these drains are placed inside of and parallel with the radial retaining walls and carry off the seepage from the made ground of the filled portion. As a further precaution against the accumulation of water under these end seats, the retaining walls are provided with 3-inch weepers every $3\frac{1}{2}$ feet, in order to give an outlet for the water in case the inside drains become clogged up.

The orchestra circle is made of a foot of loose rock covered with disintegrated granite, and is so well drained from underneath that no water ever stands on it after a storm.

About 4,000 barrels of Dyckerhoff cement were used in the building of the amphitheatre, and the entire cost of the structure was 42,000 dols. The funds were furnished by Mr. William Randolph Hearst, and the building was presented by him to the university. The concrete work was put in by Lingren & Hicks, of Berkeley, under the general supervision of Mahoney Bros., of San Francisco, who represented the owner. As already stated, the amphitheatre was erected after the general design of the university architect, Professor John Galen Howard. The engineering features were worked out by his staff.

THE LONDON BUILDING ACT.

THE District Surveyors' Association have adopted the following resolution in reference to the London Building Acts Amendment Bill:—

"Whereas the London Building Act, 1894, comprises about 700 clauses and four schedules of fourteen pages, and it is now proposed to add to this and the amending Act of 1898 a further Bill of nearly 400 clauses (and two schedules), the majority of which have to be read into the sections of the first-named Act, this Association, without reference to

THE MOMENTUM ENGINE (Patented). The Discovery of Mechanically-made Power.

NOW IN OPERATION AT THE ALEXANDRA PALACE, LONDON, N.

THE discovery; that, a free racing Flywheel possesses two natures, under one—it will receive rotary motion for the application of twenty pounds—notwithstanding it weighs a ton, and the second nature of the Flywheel is, that when it is connected to a working load it will throw out the rotary value of the centres of the weights in motion, by the square of the velocity, the centre of Gyration.

This discovery means several great Flywheels, each separately driven by any motive power, each Flywheel taking its regular turn to revolve a working shaft, to which it is connected, and from which it is disconnected for a greater length of time. Radium, and also these Engines, prove that the Theory of Energy is false. This Engine can be seen running the electric light at the Alexandra Palace. It is explained free.

The Engine has taken a first-class Diploma of Merit at the Alexandra Palace for Electric Lighting.

the merits of the proposals, submits that such a measure will be absolutely unworkable, that it will be almost impossible to grasp its provisions, and that such a combination, uncertain in its meaning and complicated as it will be, must inevitably lead to constant litigation. They further submit that the only satisfactory course in order to accomplish an amendment of the magnitude contemplated is to embody them in a new Bill to supersede the present Acts, which should only be brought before Parliament after careful consideration by the various authorities and professional societies interested therein. They further submit that many of the powers proposed to be taken by the L.C.C. are to a considerable extent such as should in the public interest be the subject of specific rules to be enacted by Parliament, and be administered by the district surveyors, who should be persons qualified by education and experience for that office. The constant reference to the Council will also cause uncertainty, great delay and expense to the public."

THE KING'S SANATORIUM.

THE King, when he paid his surprise visit last November to the sanatorium for consumptives which is being erected in his name at Midhurst, expressed a wish that the work should be pushed on so that it could be completed before the end of 1905. His Majesty inspected one of the rooms for the patients, which was practically finished for the committee's inspection, and also went all round the works, after which he stated how pleased he was at the appearance and progress of the works. The King's wish that the work should be pushed on has been fully carried out by those in authority, and rapid progress has been made. The works manager (Mr. H. W. Tingley) and the clerk of the works (Mr. W. Atkinson) very courteously conducted a representative of the *Sussex Daily News* over the building and explained the progress that had been made since the King's visit.

The east and west wings are already roofed in, and the plastering is being done, while the main part of the central patients' block has reached second-floor level. The foundations are being put in for the chapel which will be probably unique in character. The building will be V-shape and so

arranged that in wet weather the worshippers can be seated very comfortably in both aisles, while on other occasions they can sit in the courtyard and enjoy the fresh air, there being a pulpit both in and out of the chapel. The administration block is now partly roofed in and is up to first-floor level, while the laundry is being prepared for the reception of the machinery. The chimney-shaft is about 50 feet high, the proper height which it is to reach being about 90 feet.

Up to the present there has been delivered to the works three and a half million bricks with sand, lime, and cement in proportion, and considerably over four thousand yards of concrete, which has been used.

A rather interesting and beneficial idea is the construction of the verandahs or balconies in the patients' portion. These are situated so that any patient being unable to walk and desiring fresh air can be wheeled out into the open. In the lower rooms the beds can even be brought out on to the balcony.

At the present time about 180 men are engaged, and this number will be increased as the work proceeds. The accommodation for the men includes a mess-room with cooks, which enables them to have their meals properly prepared. This season the weather has been very favourable with the exception of three or four weeks of frost and rain.

An idea of the size of the building may be obtained from the fact that the front of it is about 700 feet long. Preparations are now being made for receiving the electric light for the laundry and also the hot-water apparatus. The sanatorium being situated so high above the level of the sea accounts for the climatical conditions being so different from those of Midhurst. It is often the case that when mud is prevalent in the town there is a hard frost in the vicinity of the new buildings.

When completed the sanatorium will present a very smart appearance, being built of red brick and Luton grey with dressings of Bath stone. Mr. H. Percy Adams, F.R.I.B.A., is the architect, and the builders are Messrs. J. Longley & Co., of Crawley, with Mr. Tingley and Mr. Atkinson in authority. It is hoped that the completion of the work will be effected before the end of the year. Perhaps there will be a few minor details which will be unable to be executed before that time, but it is stated that

these will not hinder the opening of the sanatorium. Periodical visits are paid to the works by the members of the committee, who express their approval of the progress made.

WESTERN INFIRMARY, GLASGOW.

THE new buildings for out-patients at the Glasgow Western Infirmary are situated to the west of the main infirmary block, and are entirely isolated from it. The dispensary forms part of a scheme for the extension of the infirmary to the west, which is urgently needed, and it will be joined to the main building by a well-lit corridor. Entering off this corridor is the electrical department, conveniently placed for both infirmary and out-patient departments. It consists of a light room, 18 feet by 15 feet; an electrical room, 50 feet by 18 feet, each fitted with the most up-to-date electrical appliances; a physician's retiring-room, and a suite of rooms on the first floor for the accommodation of nurses attached to the department.

The entrance to the dispensary proper is from Church Street, a side street running north from Dumbarton Road, in which is situated the main entrance to the infirmary grounds. Entrance and exit gates are provided leading to courtyards separating the entrance and exit doorways. Patients enter by the east doorway, and, under the control of the porter, are directed, on their first visit, into the waiting-room for new patients, where all inquiries are made, the old patients passing into the general waiting hall. The new patients' waiting-room is 26 feet by 16 feet, and is in communication with a diagnosis-room for the examination and classification of cases. The diagnosis-room is lighted by a vertical and roof-light on the north side, and adjoining it is a well-lit room for the isolation of any suspicious or infectious cases. This room has a separate door to an ambulance court.

The general waiting hall, 86 feet by 31 feet, is seated for over 400 persons. The patients will be classified into groups for convenience of distribution into the various surgical and medical consulting rooms; suitable lavatory accommodation is provided in open courts adjoining the waiting hall. From the waiting hall the communication corridor leads eastward to the main operating theatre,

30 feet by 29 feet, with gallery accommodation for sixty students. This room is lighted by vertical and roof-light from the north, and has attached to it a sterilising and recovery-room, the latter divided for male and female patients. Above this there is a nurses' room for the preparation and storing of surgical dressings, &c. Immediately to the east of the waiting hall is the surgical dressing-room fitted with arm and foot sinks, and divided by enamelled slate partitions into separate compartments. Small lobbies lead off the waiting hall to the medical and surgical consulting rooms with their necessary dressing-rooms. These five consulting rooms are 24 feet by 24 feet, each having gallery accommodation for fifty students. The lighting, as in the operating theatre, is from the north.

At the west end the communication corridor leads into the ear, nose and throat rooms, consisting of a consulting-room 30 feet by 24 feet, having gallery accommodation for fifty students (lighted as before), and communicating by a sliding door with a dark room 37 feet by 24 feet, fitted with eighteen stalls for the examination of patients by artificial light. From each of the consulting rooms separate doors lead to the exit corridor, which runs along the entire north and west walls of the building and ends in the dispensary waiting hall. This hall (30 feet by 19 feet) is seated for seventy persons, and has two service openings, with sliding doors from the dispensing-room, and adjoins the exit vestibule near the street. The dispensing-room is 30 feet by 20 feet, and is furnished with all the most modern fittings and appliances. Adjoining this room is the laboratory, which contains the aerated water machine and an outfit of steam pans. Connected with the laboratory there is a fire-proof room for the storage of inflammables. There is also a basement for the storage of surgical dressings, &c., with a good hoist. A subway will eventually lead from this basement to the new west ward block.

The walls and floors have been carefully considered from a sanitary point of view. The floors are terrazzo throughout, except in the waiting halls, where the patients are seated. The walls of the vestibules and waiting halls are faced with terra-cotta and majolica. The consulting rooms, dressing-rooms and corridors are finished with glazed tiles, and the whole is designed with a view to facilitate cleanliness. Various devices have been employed for the

Telephone No. 773 King's Cross. Telegraphic Address, "Veneer, London."

easy and mechanical control of the patients and their passage through the buildings; the doctor in charge of each consulting room being able to signal to the general waiting hall for a new patient as he passes the former one out into the corridor, which has lettered tiles directing to the exit, thus preventing patients wandering over the building. All basins, sinks, &c., have been specially designed to suit the requirements of such a building. The access door for students is on the first floor at the east side of the building, and from this a corridor, with cloak-room accommodation, leads directly to the upper level of the galleries in the various consulting rooms, one stair only being provided at the west end of this corridor. Accommodation has been provided for the janitor over the dispensary-room and waiting hall in the south-west corner.

The heating is done by low-pressure hot water, on the Reck patent circular system, the circulating water being warmed by steam, which is taken from the main boilers of the institution.

The ventilation is arranged on the extract principle, four electric fans being used for removing the vitiated air. The incoming fresh air is introduced into the ducts at several points through copper gauze screens. The building is lighted throughout by electricity, the supply being obtained from the infirmary's own installation. The grounds of the infirmary have also been lighted by means of an installation of arc lamps.

The building has been constructed from plans prepared by Mr. John James Burnet, A.R.S.A., and Mr. Thomas Young, engineer, has had charge of the lighting and heating.

ELECTRIC SMELTING.

THE Canadian Government recently appointed a Commission to investigate the various electro-thermic processes in use for the smelting of iron ores and for the making of steel.

The Commission has now issued its report as a substantial volume of 230 pages, containing plates, plans and diagrams.

Professor Harbord says:—Steel equal in all respects to the best Sheffield crucible steel can be produced at a cost considerably less than the cost of producing a high-class

crucible steel. Grey pig-iron, suitable in all respects for acid steel manufacture, either by Bessemer or Siemens process, can be produced. Grey pig-iron, suitable for foundry purposes, can be readily produced. Pig-iron, low in silicon or sulphur, suitable for basic Bessemer, or for the basic Siemens process, can be made. Pig-iron can be produced on a commercial scale at a price to compete with the blast furnace only when electric energy is cheap and fuel dear.

Dr. Haanel also points out that with electric furnaces specially designed and constructed for the production of pig-iron, instead of pig-iron alloys, the latter being combinations of metals which the blast furnace cannot produce, considerable reductions in cost of production may be secured. A large number of trials were made by the Commissioner, some 90 tons of iron being employed. The trials included the making of a number of castings, with excellent results. The metal ran very fluid, gave sharp, solid castings, and in every case was soft for machining. Several castings were made from selected grey iron and were in all respects most satisfactory. The cost of production of 1 ton of pig-iron, based upon the results of these trials, was 28s. 6d., and this included electrical energy, labour, coke, electrodes, repairs and other items of expenditure.

Other trials were made for the conversion of pig-iron to steel. These were more satisfactory than the previous operation of reduction. Steel of the highest grade, ferro-chrome, ferro-silicon, &c., was made and sent to England for analysis, which proved to be excellent.

The following is an average sample of the grey iron made during the trials:—Total carbon, 4.200; combined carbon, 0.800; graphite, 3.420; silicon, 1.910; sulphur, 0.007; phosphorus, 0.027; manganese, 4.300; arsenic, trace.

The Commission visited Sweden, Italy and France, and inspected every working process, both for reduction and conversion. The report details every cost, it analyses every claim, and it has taken nothing for granted. During the lengthy trials some member of the Commission was always on the spot, and not one of the published figures was taken excepting by means of apparatus and instruments specially tested and adjusted for the particular purpose. All members of the Commission agree that the question of electric smelting has come within the range of commercial possibilities, and is controlled chiefly by the cost of electric energy, which

should not exceed 2% per electrical horse-power per year. Another essential is the securing of a suitable situation for obtaining the supply of raw material and the distribution of the finished product.

The report has special reference to the Canadian iron deposits, which can, by the utilisation of the enormous water powers of Canada, be commercially worked and a large and important industry be created.

The report, too, has a special application for another colony—New Zealand—where it is said very pure iron-sand exists in almost unlimited quantities. Some tons of this iron-sand have been treated in the identical furnaces which Dr. Haapel used, and the most satisfactory results have been obtained.

Mr. Scott Anderson, of Sheffield, has been engaged in this work in connection with Dr. Haapel, and these gentlemen have together designed a furnace for reduction work which will greatly reduce the cost of smelting and overcome some of the difficulties hitherto experienced.

THAWING WATER-PIPES BY ELECTRICITY.

An American electric company has made arrangements for thawing street mains, service pipes and pipes in houses. The following letter from Mr. Dudley Farrand, general manager of the Public Service Corporation of New Jersey, explains his experience of the system:—

"Replying to your letter in regard to our experience in thawing of water-pipes last winter, I am pleased to give you the following data:—

"This work was begun partially, as an experiment and partially to accommodate two or three good customers who were without water either at their factory or home on account of frozen service connection. But the success of the first few hours' work was so pronounced and the feasibility of the scheme was so readily demonstrated, that it was simply necessary for us to indicate our willingness to go on with the work to produce a flood of orders, which it seriously embarrassed us to know how to handle for several weeks. The only injury done in any case was caused, I think, in the first attempt, and resulted from a

poor connection between the wire and a kitchen faucet, the result being that we melted off the faucet and burned out our transformer. Investigation showed that the mishap was caused by using too little resistance and too small a transformer.

"The first waggon was fitted up immediately after this with a considerable amount of apparatus for making calculations, but after a very brief experience all the instruments were discarded, and the operator simply gauged his work by the manner in which the water boiled in the barrel on the waggon, which was used as the resistance. Additional waggons were fitted up in this manner and the work carried on to the extent of our ability to spare men and waggons from other work. Most of the waggons contained a 300-light transformer wired up to a rough wooden rack, with primary fuse boxes on the side and sufficient lengths of wire to reach an ordinary overhead circuit, the custom being to stand the waggon alongside the pole nearest the building where the pipes were to be thawed out. On the secondary side a heavy knife switch properly fused was fastened in the bottom of the waggon and two coils of heavy wire mounted on reels were also provided.

"In the case of a single building the method of procedure was usually to connect the primary leads to the overhead circuit, insert the primary fuses, run out the two heavy wires from the reels to the desired length; one end being connected usually through the cellar window to the water-pipe, as near the cellar wall as possible, the other end being connected to the nearest hydrant or curb box, preferably on the opposite side of the street. The object was to allow treatment of the pipe at any point between the cellar wall and the street main, as there was no way of determining the exact point of interruption.

"When the pipes of two or more adjacent buildings were to be treated the water services were simply connected in series, and as a matter of fact it was found to be just as easy to thaw several houses and took no more time than it did for one. As a matter of experiment we tried grouping buildings, to see what the result would be, and the largest number we were able to find in one location, which consisted of a row of small tenements, fourteen in number, were thawed out as easily as a smaller number, although the time required was somewhat longer.

"By having sufficiently long secondary leads, we also found it more convenient to extend the secondary than to move the waggon, and in one instance we thawed out about thirty pipes without moving the waggon. The length of wire used in this case, however, was about 500 feet.

"The number of actual services thawed out of which we have record is as follows:—Newark, 2,000; Harrison, 200; Kearny, 154; Belleville, 12; Jersey City, 130; Hoboken, 125; Orange, 15; Elizabeth, 7; Morristown, 25; Passaic, 102; Trenton, 65; Perth Amboy, 3; Plainfield, 75; Bound Brook, 50; total, 2,963. The gross revenue from this work was slightly over 12,000 dols. The charge rendered in each case varied from 4 dols. to 15 dols., according to the number of connections.

"In one case a 6-inch main was thawed out simply as a matter of experiment, the time required being about three hours. The record, however, as to the amount of current required is not at hand at this writing and I am unable to give full particulars. There is no doubt in our minds that this practice of thawing water-pipes cannot only be made profitable to electric companies, but also that the public would be willing to pay a good round price for the service, as the expense involved in digging up frozen ground usually runs into large figures, to say nothing of the expense of restoring pavement and the annoyance of broken pavement which cannot be properly relaid until warm weather returns.

"The number of services that can be handled by one outfit in a day depends entirely on local conditions of poles, wires and location of service. Our outfit consists of two men each with a horse and waggon equipped as above, and each outfit averages all the way from 10 to 200 pipes thawed out per working day."

TUNNELLING THE DEE.

In his report to the Town Council of Aberdeen on the progress made during 1904 with the Girdleness outfall works for the sewerage of the city, Mr. William Dyack, burgh surveyor, dealing with the river Dee tunnels, says:—During the past year progress with this section of the contract has

been unfortunately delayed owing to unforeseen difficulties having arisen. At Point Law the tunnel shaft was sunk to the required depth—viz. 53½ feet below high-water of spring tides—by the middle of May, after considerable trouble had arisen, due to a large influx of water in the bottom of the shaft and the subsidence of the surrounding strata between the tunnel shaft and the quay-wall cylinders of the Harbour Commissioners. The shaft was successfully plugged with concrete by divers in October. At Torry a commencement was made to tunnel under the river bed in May, and the attempt to remove the shaft segments to permit of an entrance being made was one of extreme difficulty, water flowing into the shaft in large quantities under pressure. Considerable time was spent in endeavouring to overcome the inrush by large steam pumps, but the operations were suspended on May 26 until arrangements could be made for carrying on the work in safety by means of compressed air. The remainder of the year has been occupied in fitting up the temporary plant necessary to carry out the work of tunnelling under compressed air. In the Torry shaft two steel floors have been built, fitted with all the necessary arrangements to form an air-lock. An air-compressing plant, consisting of two 40 horse-power Ingersoll-Sergeant air compressors, each capable of supplying 38,000 cubic feet of free air an hour to the tunnel, has been laid down in Sinclair Place (200 yards west of the tunnel), adjoining the engine and boiler-house of the old Torry brickworks, which has been altered and adapted for supplying steam to the air compressors. The whole of the temporary plant has now been completed; a medical air-lock has also been provided at the top of the Torry shaft as a precautionary measure for use in the event of any of the workmen suffering from compressed air illness. This, however, may not be required, as a low air pressure may be sufficient to carry through the work successfully. The tunnel was put under air pressure recently, and it will now be maintained night and day until it has been driven from Torry to Point Law. A small tunnel heading has been driven 26 feet from the shaft under the river, and operations will now be pushed on vigorously to allow of the hydraulic shield being placed in position as early as possible. The total value of the work executed in the whole contract up to the present date is 50,200l.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

YORK.—Feb. 6.—For additions and alterations to the school of science and art, Exhibition Buildings. Mr. A. Creer, architect, Guildhall, York.

PROFESSOR HENRY ADAMS, M.I.C.E., who recently retired from the City of London College, has been appointed a chief examiner in building construction under the Board of Education, South Kensington.

THE harbour of Cuxhaven, built comparatively recently at a cost of 7,750,000 marks, is at the present moment the subject of a controversy in Hamburg shipping circles. The Hamburg-American Company, for whose boats this harbour was mainly built, is much dissatisfied with the accommodation, and is preparing to transfer its harbour business entirely to Hamburg. It is alleged of the harbour that both entrance and exit are rendered difficult by the existence of strong currents, the entrance being even described as actually dangerous. The currents are so strong that a heavy deposit is being continually formed. Very much irritated at these statements, the town of Cuxhaven appointed a commission to inquire into the alleged defects. After a lengthy hearing of experts and other witnesses and an independent examination of the harbour roads, the commission reported that there was no justification at all for the attitude of the Hamburg-American Company. It was also stated that before the harbour was built the details of the scheme were fully discussed with this company and received its approval.

NEW CATALOGUES.

THE array of medals which Messrs. T. & R. Boote, Ltd., of Burslem, have won in exhibitions may be accepted as a testimony not only to the excellence but the variety of their productions. Jurors have their preferences. In the latest catalogue are examples of glazed dado and wall tiling, printed and coloured tiling, cappings, skirtings, angle beads, slopes, &c. There are also examples of ceramic mosaics, enamels for fireplaces, &c., and an abundance of tiles of geometrical patterns for floors. It will therefore be evident that Messrs. T. & R. Boote are provided for all demands which are likely to arise. All the tiles are numbered, which facilitates ordering. If cases should arise which the tiles will not serve special designs will be prepared. The firm will also supply instructions whenever trained workmen for laying tiles are not available. Everything suggests readiness to meet the desires of customers. Patterns and colours are attractive and the prices reasonable. Unquestionably the firm have attained great perfection in their productions.

ALTHOUGH a month of 1905 has vanished, it is not too late, perhaps, to mention the neat, convenient and ingenious diary issued by Messrs. Charles Winn & Co., of Birmingham. From the peculiarity of the binding it may be said to form a compound but tiny volume, one being a diary with a page to a week, the other made up of sectional paper which will serve for sketching. A few pages are assigned to the "Blount Door Spring and Check" of the firm, which

is used throughout the London Hippodrome and the Coliseum, and in many other important buildings. It is the handiest diary of the year, and any one in the trade can have one on application to Messrs. Charles Winn & Co.

THE Berkefeld Filter Company, Ltd., recently brought on the English market "Winco" semi-rotary wing pumps and a descriptive price list has now appeared. It is claimed for the pumps, which are simple in construction, that they are of the greatest possible efficiency and easily adapted to hand, horse, steam, water or wind-power. There is, for instance, the "Winco" semi-rotary pillar and barrow pump which is adapted for such purposes as garden, street and village use, or for public establishments, while the "Winco" double-acting semi-rotary wing pump is suitable for thick liquids, or in a slightly different form for raising and transferring wine, oil, &c., from casks. The pumps of cast-iron with brass valves are, of course, appreciably cheaper than those all brass. The pumps are capable of lifting the liquid from a depth of 25 feet and forcing it to a height of 100.

It is a peculiarity of a great business like Messrs. Johnson & Phillips's, of Old Charlton, that a very few pages will serve for a catalogue as well as a large volume. Their products are measured by miles rather than by feet and inches. They have supplied and laid 45 miles of electric cables at Weymouth, 55 miles at Horsham, 100 miles at Pembroke and Portsmouth, 22 miles at Birkenhead, &c. Nor is it in Great Britain alone their work is recognised. They have carried out large contracts in Bombay, Calcutta, Kimberley, Malta, and in their list nearly all the letters of the alphabet are utilised. It is not only cables which are manufactured by the firm. They have specialties in junction boxes, disconnecting boxes, feeder boxes, house-service boxes, switch pillars, &c. Messrs. Johnson & Phillips are electrical engineers and contractors, and the words are to be taken in the widest sense.

MR. THOMAS G. JACKSON, R.A., will on Thursdays, March 23 and 30, deliver two lectures at the Royal Institution illustrated by lantern slides, on "The Reasonableness of Architecture," in the place of Sir John Stirling-Maxwell.

A SPECIAL committee of Worcester Chamber of Commerce has prepared a scheme for the formation of a trust for inland waterways in the Severn district.

THE Kensington Borough Council on Tuesday decided to contribute one-third of the net cost of the widening of Church Street and Silver Street, leading from Kensington High Street to Notting Hill Gate.

THE Rugby Town Council have finally adopted a scheme for the extension of the sewage works prepared by Mr. D. G. Macdonald, the town surveyor. A site of about seventy acres was purchased some years ago for this purpose. The outlay is estimated at 17,000*l*.

THE committee on the proposed harbour improvements at Douglas have issued their report. The extension of the berthage for steamers at each side of the Victoria Pier, to a total length of 800 feet on either side, is recommended at an expenditure of 30,000*l*.

THE streets committee of the City Corporation, at a meeting recently held at the Guildhall, resolved to recommend the Court of Common Council to oppose the proposal of the London County Council to run tramways over Blackfriars bridge and along the Victoria Embankment for the purpose of linking up the southern tramway system.

A POLL took place at Wigan last week with reference to the Wigan Corporation Bill, which seeks power to borrow a sum of 165,000*l*. for the purpose of providing a new town hall, new baths, cattle market and other improvements. The result was:—For the Bill, 2,128; against, 1,864; majority for the Bill, 264.

A NEW edition of "English Clubs," a list of over 3,097 clubs frequented by the English in all parts of the world, for 1905, has just been published by Messrs. Spottiswoode & Co., Ltd. It is edited by Mr. E. C. Austen Leigh, M.A. The book, which has been thoroughly revised this year, is handsomely bound in red cloth with gilt lettering and printed in tabular form. It gives much information about each club.

THE Secretary of State for India has sanctioned the proposals for financing the scheme adopted by the Local Government for the improvement of Madras harbour. The scheme provides for the closing of the present exposed harbour entrance, and the opening of another in the north-east wall of the harbour, which will be protected by a breakwater about 1,200 feet long. The cost of the scheme is estimated at 306,666*l*.

THE Finsbury Borough Council are considering the advisability of preparing a scheme for the erection of baths and washhouses in St. John Street. It is proposed to erect a swimming bath 100 feet by 35 feet, and to provide seventy-three men and women's slipper baths and fifty washers. Offices and club-rooms would also be included, and the total cost would be 66,569*l*.

THREE Italian engineers have prepared a project to improve the steamship facilities of Venice. It is proposed that new docks will be built on the left of the railway bridge. The docks will have more than 2½ miles frontage, and the portion in Venice will be connected with the portion on the mainland either by two bridges or by a platform attached to the existing railway bridge. The cost is estimated at a million sterling.

"CORPORATION of Glasgow Municipal Enterprises" is the title of a handbook describing in some detail the work of the various departments of the Corporation. Originally the book was published for the members attending the Sanitary Institute Congress in July last. It has now been reprinted for issue to the public, with an introduction by the Lord Provost and the addition of several pages bringing the information up to date.

MR. W. P. HALE, the surveyor to the Montgomery Town Council, has resigned his position after thirty-one years service, in consequence of the interference of the Council

in his relations with the workmen. The salary is 7*l.* 10*s.* a year, and a suggestion that he be asked to reconsider the matter was objected to by Mr. Maurice Owen, who remarked that they could get a man to do the work for 2*l.* or 3*l.* a year.

THE New York municipal authorities have just assessed the taxable value of the six principal hotels in the city as follows:—Waldorf-Astoria, 1,837,000*l.*; Hôtel St. Regis, 460,000*l.*; Holland House, 320,000*l.*; Hôtel Belmont, 500,000*l.*; Imperial and Annex, 587,000*l.*; Hôtel Astor, 440,000*l.* Mr. Schwab's residence has been valued at 260,000*l.*, and Mr. W. A. Clark's Fifth Avenue mansion at 420,000*l.*

DR. GORE, the Bishop of Birmingham, in speaking at a meeting on Monday said he understood there had been some correspondence in the papers lately with regard to a new cathedral for Birmingham. He wanted to say this with as much emphasis as possible—that they would dismiss all thoughts of building a great cathedral altogether from their minds for the present, and leave it to another generation. The primary requirement was to erect new churches.

THE Tottenham District Council erected a new fire-station and put up a marble tablet upon which the names of the councillors and officers were duly set forth. The Local Government Board auditor has disallowed the cost of the tablet, intimating that he fails to see how it can be regarded as furniture. He also disallowed the expenses of deputations sent by the Council to the Sanitary Congress and the Congress of the Institute of Public Health.

A MEETING was held at Lahore on January 3 to discuss the question of completing the cathedral by lengthening the nave and raising the two towers. The Bishop explained the plans drawn up by Mr. Bodley, R.A., and showed that the present edifice, which is squat and undignified and foreshortened, owing to financial disabilities at the time of its erection, could be converted into a handsome structure. The cost of the improvements is expected to reach a total of nearly a lac of rupees (6,666*l.*).

A PETITION to the Board of Trade to take steps to prohibit the removal of sand and shingle from the Essex foreshore having been supported by the Harwich Town Council

and by the Urban District Councils at Walton-on-the-Naze, Clacton and Frinton, the Poor Law Guardians in the affected areas are now being asked to endorse the memorial. The general opinion of expert engineers who have been consulted by local authorities on the Essex seaboard is that the continued encroachment of the sea is to a considerable extent assisted by the constant removal of the natural protection of the cliffs.

THE Wolverhampton Board of Guardians have agreed to an expenditure not exceeding 23,253*l.*, in addition to the 177,066*l.* already sanctioned, in connection with the erecting and furnishing of the new workhouse, and for this purpose 25,000*l.* will be borrowed. It was stated the amount incurred up to the present had only been 195,647*l.*, of which the following items had yet to be paid:—Builders, 13,479*l.*; architect, 673*l.*; contractors for pipes, 42*l.*; charges in respect of loan, 50*l.*; due to treasurer, 12,243*l.*

THE Municipality of Vienna will, it is stated, shortly invite tenders for the execution of the following works:—Extension of the tramway system, cost about 256,250*l.*; establishment of a second water system, cost about 120,833*l.*; construction of bridges, cost about 37,500*l.*; extension of electric light system, cost about 250,000*l.*; paving works, cost about 112,375*l.*; construction of a market, cost about 16,666*l.*; of a central abattoir, cost about 20,833*l.*; a museum, cost about 2,083*l.*; works at the central cemetery, cost about 54,152*l.*

THE Hampshire County Council and the rural district councils whose roads have been affected by the extraordinary military traffic caused by the construction of the camps at Bordon and Longmoor, have succeeded in convincing the Secretary for War that their claims for damage—amounting to more than 10,000*l.*—are just, and sums have been received on account. The Army Council at first asked the authorities to recover the amount from the several contractors. The authorities refused to do so, and the Army Council has given way on the point.

A LOCAL Government Board inquiry has been held in Liverpool in regard to an application of the Corporation for sanction to borrow 35,000*l.* for the purchase and demolition of insanitary property under the powers of the Liverpool Sanitary Amendment Act, 1864. The application originally

was for sanction to borrow 50,000*l.*, but the Local Government Board granted 15,000*l.* to enable the Corporation to get on with work that they had in hand. The 50,000*l.* is part of a sum of 200,000*l.* borrowing powers in respect of which a provisional order was obtained in 1901.

THE Salford Town Council have under consideration a scheme for the erection of salt-water baths. The site of the building will embrace about 2,000 square yards, and the total cost is estimated at 20,000*l.* The building will comprise a second-class swimming bath, a first-class bath with six first-class and twelve second-class slipper baths. A storage reservoir of salt water not less than 100 feet in length by 40 feet in width and 10 feet in depth, the holding capacity being 250,000 gallons of sea water, will be placed close to the embankment of the ship canal at the Salford sewage works.

THE Glasgow Royal Infirmary Board state in their annual report that the subject of reconstruction of the infirmary and the plans affecting interior arrangements in every department have during the past year engaged the constant and anxious consideration of the managers, along with the architect and others, and they are pleased at being able to report that their labours promise to be completed in a short space of time, so that the work of reconstruction may be commenced without delay. The sum required to be subscribed to defray the estimated cost of the entire undertaking is still large, being not less than about 100,000*l.* in addition to what has been already subscribed.

THE streets committee of the Corporation have been considering the London Building Acts (Amendment) Bill about to be introduced into Parliament by the London County Council, and have decided to recommend that the Aldermen of each ward be requested to arrange for wardmotes to discuss the provisions of the measure, and that the Lord Mayor be invited to call a public meeting of citizens and ratepayers in the Guildhall to consider the Bill after the wardmotes have been held. The Kensington Borough Council are inviting the City to send delegates to an early conference of the metropolitan municipal authorities on the subject.

THE Manchester Corporation have made exhaustive experiments concerning the efficiency of destructors dealing with ordinary town refuse. The trials lasted two days, the duration being 16½ hours, and in that period about 40 tons

of refuse were disposed of. The water was fed into the destructors at from 35 to 37 degs. Fahr., and yet each pound of fuel or refuse gave on an average 1.78 lb. of steam. The heat utilised in the production of steam amounted to 36 per cent. The heat carried up the chimney amounted to an average of 19.3 per cent, with an evaporation of 1.8 lb. per lb. of refuse. Such refuse, even when particularly dry, has a steam-raising value equal to five times its weight of Welsh coal.

THE theatres committee of the London County Council have called attention to the non-observance of the Council's rules in regard to scenery, properties, hangings and curtains in places of entertainment being non-flammable, which were adopted on March 1, 1904. Similar regulations were issued by the Lord Chamberlain for the theatres in his jurisdiction on November 1. The theatres committee is informed, however, that the rules are as yet by no means generally complied with, and it has therefore caused a letter to be sent to the managers of theatres calling their attention to the necessity of complying strictly with the rules in question. The Lord Chamberlain has taken similar action with regard to the theatres in his jurisdiction.

THE report made by Mr. James Walker, of Newcastle-on-Tyne, with reference to the damage done to the new Marine Drive sea wall at Scarborough by the recent tidal wave and severe gale indicates that the injury is much greater and more serious than it had appeared. Mr. Walker states that, roughly, 540 feet of the wall has become broken up into lengths by vertical cracks and to have moved slightly forward. At the earliest possible moment measures should be taken to prevent further forward movement and to protect the shale at the toe of the wall from being disturbed and washed away by the action of the sea. The causes of the damage were probably the impact of water against the face and its presence at the back of the wall. Remedial works, however, would not be practicable at this season of the year.

THE Wakefield Town Council contemplate making application to the Local Government Board for sanction to the borrowing of a further sum of 18,000*l.* for the purposes of extensions in connection with the electrical undertaking.

ELECTRIC NOTES.

THE Macclesfield electricity committee has decided to recommend the Town Council to appoint a consulting electrical engineer to formulate a scheme of electricity supply, the cost of which must not exceed 20,000*l*.

An American firm has secured the contract for the construction of an electric street railway in Montreal. The Americans offered to do the work considerably cheaper than it could be undertaken by local contractors.

THE new refuse-destructor at Preston generates more than sufficient steam to drive the electric trams in the borough and to light the Corporation storeyard, and the scavenging committee are now endeavouring to apply it to the driving of machinery upon their premises.

MR. ROSS HOOPER, a Local Government Board inspector, at the Rochdale town hall inquired into an application made by the Rochdale Town Council to borrow 42,405*l*. to extend the electric works and machinery for the increase of electric lighting, and an extension of the tramways.

THE new electrical and mechanical laboratories at the Preston technical school, which the generosity of the late Mr. John Billington Booth provided, were formally opened on Monday. The trustees contributed 2,500*l*. and Messrs. Dick, Kerr & Co. 500*l*. towards the cost of equipping the laboratories.

IN a report on the subject of halfpenny tram fares in Liverpool Mr. Bellamy, the general manager of the tramways, has reported the opinion that halfpenny stages would seriously jeopardise the commercial stability of the undertaking. As to workmen's fares, he thinks no change should be made, as workmen are rather better off in that respect in Liverpool than elsewhere.

THE Arbroath Town Council were recently informed by the Board of Trade that their provisional order for the introduction of electric light would be revoked owing to the delay. The Board of Trade have since consented to grant a three months' extension in order to enable the Council to bring their negotiations proceeding with a company to a conclusion.

DURING the two days of the exceptionally foggy weather which prevailed during the week preceding Christmas, and when traffic in London was almost paralysed, the takings on the Council's southern tramway lines amounted to over 2,500*l*. The drivers of the electric cars gave most efficient and able service under difficult and trying circumstances, and it was abundantly shown that in weather of that kind electric trams afforded a far superior means of traffic over any other.

THE chairman of the South-Eastern Railway Company stated at the half-yearly meeting on Monday that the decrease in the passenger traffic was mainly due to the falling off where the tram competition was most severe. They could not hope to compete with the electric trams, aided as they were by the rates. They could only meet this competition by taking off a certain number of trains which had been put on for the accommodation of the working classes, and which they were now leaving, and also to a certain extent partially closing some of the stations which were principally affected.

THE organising committee of the electricity section of the International Exhibition of Liège has decided upon introducing a new feature, viz. the reservation of a certain considerable space especially for working electricians. No employer of more than five men will be admitted, and the employer himself must be a working electrician. Small employers will pay a small charge for space, which will be free to workmen exhibitors. The purpose of this reservation is to throw open a field for apparatus and inventions which would otherwise seldom come before the public.

THE Liverpool Corporation electric supply accounts for last year have been issued by the controller and auditor of accounts (Mr. Richard Barrow). These show that the income on revenue account totalled 236,404*l*., of which 135,631*l*. was from electrical energy for lighting and power, 2,371*l*. from public street lighting and 91,674*l*. from tramways. On the expenditure side there is 65,192*l*. for the generation of electricity, 4,752*l*. for distribution, 16,431*l*. for rent, rates and taxes, and 11,455*l*. for management expenses. The net balance amounted to 44,510*l*., of which it has been resolved to transfer 16,285*l*. to the reserve fund, 11,289*l*. to the renewal fund and 16,934*l*. 9*s*. 5*d*. to the general rate.

THE electricity committee of the Manchester City Council recommended the appointment of Mr. S. L. Pearce, electrical engineer, for a period of three years, on the following terms:—Salary for the first year at the rate of £1,000 per annum; for the second and third years £1,000 per annum. Mr. Pearce to enter into an agreement to remain in the employ of the Corporation for three years from February 1, 1905, and to devote the whole of his time to the duties of the position and in carrying out any electrical extensions or works in the future that may be required, the engagement to be subject to any arrangement which the Corporation may from time to time make with consulting engineers.

THE Aberdeen Town Council made an inspection on Friday of the Corporation electricity works and the extension of the subway. The works and machinery, roughly estimated, cost a quarter of a million pounds. For the first half and a half months ending January 19 there has been an increase of 602,418 units of electricity generated, as compared with the corresponding period last year, and the increase in the number of consumers this year compared with last year was 173. The length of the subway is 780 yards. It took thirteen months to build and the cost was £200,000.

THE National Electric Construction Company have given formal notice that an application will be made in March for a provisional order to authorise the construction of tramways from Edinburgh to Queensferry. The starting-point in Edinburgh will be the west end of Princes Street and the termination of the cables at Comely Bank. If the order is obtained from Parliament, satisfactory guarantees will be given that the tramways will be laid and working within the shortest possible time after sanction has been got. In the letter to the town clerk of Edinburgh it is also suggested that the current might be got from Edinburgh Corporation.

THE Edinburgh and Leith gas commission recently sent a letter to the town clerk of Leith in connection with the electric tramways operations, pointing out the disadvantage of leaving gas mains under the tramway tracks, which might necessitate a stoppage of tramway service in order to allow the commissioners to have access to the pipes.

The letter suggested that the Leith Corporation should bear half of the estimated cost of 2,000£ of removing such pipes, the commissioners to bear the other half. A reply has been received from the Leith town clerk declining to undertake the removal of the pipes, with the result that they will have to remain.

THE Lincoln Corporation appear to have got over their difficulty with regard to their scheme for electric tramways. An Act of Parliament was obtained sanctioning the laying of a 3-feet 6-inch gauge, but the electricity works committee later decided to adopt a standard gauge of 4 feet 8½ inches. A communication has been received from the Board of Trade notifying that there will be no need to obtain a new Act. The Act now empowering the Corporation to lay down a gauge is, it is contended, sufficiently elastic to permit the altered scheme to be proceeded with. The main condition is that a space of 9 feet roadway must be allowed between the outer edge of the outer rail and the edge of the kerb, and this can be complied with.

THE Cumberland County Council have been making inquiries into the question of lighting the asylum. Tenders were received for various forms of lighting. From a statement showing the relative cost of the various methods of lighting, along with a comparative statement of upkeep, submitted by the tenderers themselves, the following figures may be given:—Ordinary gas: Initial cost, including repairs of existing asylum, 1,175£; estimated annual upkeep with cost of gas, 666£. Incandescent gas: Initial cost, 1,989£; estimated upkeep, &c., 662£. Acetylene: Initial cost, British Acetylene Company 1,932£, Manchester Acetylene Company 2,219£, Acetylene Corporation of Great Britain 2,835£; estimated annual upkeep, British Acetylene Company 706£, Manchester Acetylene Company 876£, Acetylene Corporation of Great Britain 736£. Electric lighting: Initial cost 6,607£ and annual upkeep 505£.

THE London and North-Western Railway Company propose to alter and enlarge their station at Crewe. This has been rendered necessary by the railway extensions which have been in progress for several years, and have cost more than half a million. The foundations for the new station are being laid. The work is likely to occupy two years.

BUILDING AND BUILDERS.

THE War Office have ordered that the work of erecting new quarters at Portsmouth for sub-lieutenants on Whale Island is to be at once proceeded with. The new building is to cost about 50,000*l.*, and will accommodate 100 officers. It is to be completed in seven months.

THE Associated Carpenters and Joiners have selected Glasgow as the "seat of government" for the next three years. At present the headquarters of the Society are in Edinburgh. The voting was:—Glasgow, 1,598; Newcastle, 311; Liverpool, 73; Paisley, 46.

A COMPANY has been formed to acquire the various leasehold interests in the block of property lying between Piccadilly and Regent Street, at present occupied by St. James's Hall, St. James's Restaurant, and other business establishments, and on this magnificent site to erect an hotel and restaurant, with shops on the ground floor. Messrs. Emden & Woodward are joint architects. The outlay is expected to exceed 1,000,000*l.*

A LARGE amount of money has to be expended in the Middlewich and Winsford districts of Cheshire upon the erection of new schools and the enlargement of existing schools. Plans for a new Council school at Middlewich are being considered, and it is estimated that the cost will be about 13,000*l.* A new infant school is required at Winsford. High Street Council school (Winsford) is to be enlarged, and the tender of a local firm at 3,948*l.* has been accepted.

THE Carpenters' Company have arranged a series of lectures to be delivered in their hall in London Wall on Thursdays in February and March, commencing on the 16th inst., when Sir William White, F.R.S., will discourse on "Modern Warships." The other lectures are "Our Old Parish Churches," by Rev. W. Marshall; "The Livery

Companies and their Halls—Ancient and Modern," by C. Welch; "The Origin and Development of the College Plan at Oxford and Cambridge," by Mr. J. Willis C. "The St. Louis Exhibition, 1904," by Mr. H. Ph. Fletcher; and "The Cultivation of Oak, Ash, Beech and other Hardwood Trees in the British Isles."

THE Liverpool Builders, Contractors and Property Owners' Defence Association held their third annual meeting last week. During the past year the question of extending short leaseholds into 999 years lease has been under consideration, and letters had been sent to the Earl of Sefton and the Marquis of Salisbury asking them to give the matter their careful consideration. Several matters of dispute that had arisen between corporate officials and members were effectively dealt with. A letter has been sent to the Corporation recommending them to keep a register of furniture removers and compelling each of them to furnish a list each week of all removals, with particulars as to where from and where to the furniture has been removed. The effect of this, it is hoped, would be a great saving to property owners and the city fund generally.

THE original Parliamentary estimate for the construction of the London County Council of the Greenwich Tunnel was 70,500*l.* only, whereas up to date the cost appears to be 180,117*l.*, and there is more to come. The discrepancy arises from the scant provision made for the acquisition of land. The sum set apart for the purpose was 5,500*l.*, but the disbursements in this direction now stand at 58,000*l.* On this point the finance committee state in their report: "Much of the additional cost is due to clauses which were inserted in the Bill when it was before the committee in Parliament, but we cannot help thinking that it ought to have been possible to frame a more satisfactory estimate of the probable cost of this undertaking than that originally placed before the Council."

THE Surveyors' Institute discussed on Monday the question of building by-laws. Mr. Herbert Smith declared that in country districts the mischievous attempt to amend the building laws of London had been attended with great injury to public interests and in some instances with discredit to the authorities. He advocated the formation of a tribunal to which there should be a right of appeal from

sions of local authorities. Mr. McMorran, K.C., said by-laws from beginning to end required revision, and vision by experts who knew where the shoe pinched. felt that the time had come when a building code should be prepared which was capable of being understood by everybody, and which should serve for the whole country, never being given to local authorities to make by-laws as matters of detail to meet local requirements.

The committee of Edinburgh plumbers and ironmongers unanimously agreed that the following resolution with reference to the decision of the Gas Commissioners on the subject of municipal trading be sent to the Commissioners:— That the joint committees of plumbers and ironmongers get the decision of the Gas Commissioners on the subject of municipal trading, and also that no reply has been given to the prayer of their memorial, viz. that a committee be appointed to confer with the traders with a view to preparing a working arrangement. The committee feel that it is due to the public that an independent investigation should be made into the working of that department with the view of ascertaining correctly what if any profit is the result of the operations thereon distinct from the manufacture and sale of gas, and also whether the additional gas consumer in consequence of the use of gas-burners has effected the reduction in the price of gas which is claimed for it, more particularly as it is understood that the accounts of the Commissioners for the last financial year showed a considerable adverse balance."

THE WAGE PROBLEM IN LIVERPOOL.

The Liverpool City Council will soon have to decide, says the correspondent of the *Liverpool Courier*, two important questions of principle. Are the wages of the unskilled labourers of the Corporation to be advanced to 24s. a week, irrespective of length of service and the nature of the work upon which they are employed? Should such increase, if granted, be accompanied by any restriction as to age? I should like to make some suggestions in regard to what is involved in the proposal. At its last meeting the Council adopted Mr. Byrne's amendment in favour of paying 24s. a

week to able-bodied labourers without any condition regarding age, but when it was sought to be passed as a substantive motion a Liberal alderman announced his intention of moving the restoration of the expunged clause respecting the age limit, whereby it was provided that this higher wage should only be paid to able-bodied workmen above twenty-one and under fifty years of age. At this stage the debate has yet to be resumed.

The attempt to carry the proposal with or without an age limit, it will be realised, places the Council on the horns of a dilemma. If no such limit be imposed the older labourers will no doubt soon have cause to rue the sort of "betterment" in contemplation. Corporation officials have a sufficient sprinkling of human nature in their composition to wish to earn the credit of producing the best results with the means at their disposal. This is my experience of them. If a wage of 4s. per day be compulsory these officials will give preference to the able-bodied man in his prime, and the bitter cry of the Corporation labourer, "too old at fifty" or at forty-five, and even younger, will soon be heard throughout the city. On the other hand, if the increased wages be granted and the age limit enforced, the result must in many instances be prejudicial to the men of younger middle age. The proffered services of the robust labourer a little below twenty-one or just above fifty will always be accepted because he will only be entitled to the lower wage, and the able-bodied man between these ages will have to take his chance of employment. The difficulties of the position need not be accentuated, they are obvious and apparently insurmountable. It is only right that the Council should realise the hardships which it must inevitably inflict upon one or other class of labourers if it should resolve to change the existing order of things.

The problem is further complicated by the present stagnation of trade and commerce in Liverpool, as elsewhere. Those who advocate the proposal to which I refer ought logically at the outset to move that the municipal rates for 1905 be increased by a penny, and perhaps three halfpence in the pound. The adoption of the 4s. a day suggestion would necessitate an immediate increase of at least 13,000*l.* a year in the Corporate expenditure. There are financial authorities who hold that the outlay will be much greater. That sum would undeniably be the

minimum cost of placing the whole of the able-bodied labourers on a uniform wage of 24s. a week, but, unfortunately, it makes no provision for increased earnings by the labourers who, by reason of experience, superior capabilities and the better class of work with which they are entrusted, already receive 4s. a day. If the lower grade of unskilled labourer be paid better wages the higher ranks must in common fairness be correspondingly increased. This aspect of the matter has not been considered in the estimate of 13,000l. It is, indeed, calculated that the adoption of the proposal will involve the Corporation in an additional outlay of 18,000l. to 20,000l. a year. Is this the right moment to impose such an extra burden upon the ratepayers?

The current rate of wages for this class of labour in Liverpool is 18s. to 21s. a week. Under the prevailing system all unskilled Corporation labourers receive a minimum wage of 21s. a week. Sweepers whose wages are nominally 21s., are actually paid 22s. 9d. on account of a few hours' work performed on Sundays. Other classes of unskilled labourers are now receiving wages ranging up to 24s. a week, their payments being adjusted according to their abilities and the character of their work. Matters are, in fact, so arranged that as a man shows adaptability and opportunities for better work arise, he gradually rises from 21s. to 24s. a week, while other advantages of the Corporate service are regularity of employment, a small compensation in case of injury or death, and also some recompense in case of enforced retirement after long service. The innovation now suggested is that a man coming to Liverpool straight from the plough, with no experience and no talent beyond mere physical strength, should immediately receive 24s. a week. It is not difficult to foresee that when an offer of this kind becomes known in the country districts there will be such an influx into this city as will add materially to the difficulties of our own unemployed problem.

Many struggling business men in Liverpool to-day find it hard enough to pay the current rate of wages for unskilled labourers. It is proposed that these citizens should be still more heavily rated to enable the Corporation to pay increased wages to draw to its service the best labour of the kind in the market. One of the severest reproaches made against the Tammany system is that it uses public money

to pay inflated salaries to public servants. It might be considered a misuse of terms to designate 24s. a week earned by a labourer as an inflated salary; but, after all, these phrases are only comparative. If the standard rate of wages for an unskilled labourer ranges from 18s. to 21s. a week, and the rating authority taxes the community to pay its particular unskilled labourers 24s. a week, one of the most vicious principles underlying Tammany will have been imported into the municipal government of Liverpool. A special committee of the Council has already reported against the proposal, and its investigations were directed mainly to the effect which its adoption would have upon the Corporate service. Have the Council yet considered the influence of such increased wages in tempting the agricultural and other unskilled labourer to gravitate to Liverpool in search of work rather than to Manchester, Leeds, Birmingham or other populous centres? Have they reflected on the position in which they will thereby place the Dock Board, the railway companies and employers of labour generally? If the Corporation pays its labourers 24s. a week these concerns may be driven, in the stress of competition, to follow suit. That is precisely the result at which certain Labour leaders are aiming, and while in some respects it is a consummation devoutly to be wished, it must not be overlooked that heavier burdens will in that event be borne by the ratepayer, while the strain may be too severe for many a private firm.

When a public authority makes its service attractive by paying more than the standard rate of wages, it is well-nigh impossible to keep clear of the cloven hoof of political corruption. Attempts in this direction have not been altogether unknown even under the present system. What the result will be if the Corporate service be made more remunerative than any other it needs no gift of prophecy to foretell. The proposal, I am convinced, would be prejudicial to the workmen themselves, because in the weeding-out process to which it would inevitably give rise many of the present employes would be driven to swell the ranks of the unemployed. The ratepayer may also murmur that the very period when the most rigid economy has been practised in every other department of municipal life, solely out of pity for his pecuniary distress, should be chosen for casting this additional burden upon his shoulders.

ADVICE TO ART STUDENTS.

THERE was a large attendance at the Birmingham Central Municipal School of Art, Margaret Street, on Saturday evening, says the *Birmingham Daily Post*, when the Government and local certificates won by the students during the past year were distributed.

The Chairman (Mr. C. J. Hart) briefly addressed the students on the advantages of drawing from utilitarian and other points of view. He thought a knowledge of drawing as essential to almost everyone in a great place of industry like Birmingham. It was particularly useful to carpenters, joiners, bricklayers and everyone connected with the building trade, and the stonemason was also one who would find study indispensable. They should not, however, rest content with the commercial value of drawing. There was great pleasure to be derived from the study of art, and it also taught students to observe, so that when they went into the country they understood what was beautiful and could properly appreciate it.

Mr. Edwin Smith opened his address with a reference to the object of the branch classes held in the elementary schools. It was often said that these evening classes met in buildings that were unsuitable for the teaching the students desired to obtain, and that, feeling this, they worked in the classes under a sense of discouragement. That was undoubtedly true to some extent, but not, he thought, to the full extent of the complaint. The school committee knew that the best art teaching could only be given in schools like the Central and those at Moseley Road and Vittoria Street. In those the permanent fittings could be properly adapted to the teaching, and care could be taken that the students were continuously supplied with those necessary examples to their studies which required special preservation from lesson to lesson. The primary object of the classes in the elementary schools was to rightly prepare students for the teaching in the committee's own buildings. The committee did not desire to encourage the higher teaching in these branch evening schools. They knew it could not be efficiently done in them, and they did not therefore attempt to supply the appliances necessary for the most advanced work. They were, however, satisfied that really good work

in the teaching of drawing could be done in these classes, and they were striving to help the head-masters in every way to make the work not only more effective from year to year but also more and more interesting to the students.

Yet, however strongly the committee might be convinced that this part of their work might be useful, they could not disregard the unmistakable evidence they had before them that the feeling or prejudice that the elementary schools were not the right places for the work was not to be completely overcome. At Moseley Road and Vittoria Street there were about 1,000 students in the evening classes between the two schools. At Moseley Road alone the number was from 400 to 450. In the nine branches held in the elementary schools of the city the total number of students did not reach 1,200, and in no one of them did it come up to 200. There could be no more striking lesson than this of the need of suitable buildings for use as branch schools of art. Such buildings need not necessarily be costly. Three or four large plain classrooms with suitable offices were all that was essential. The ornament for the rooms could best be provided in the examples to be placed on the walls. In some such way he hoped they might find the solution of the difficulty that was delaying their progress, for he felt with, he believed, his colleagues on the committee that as long as the Moseley Road school failed to be fully occupied in the day as well as in the evenings the Council would not think it true economy to provide a series of branch schools on the scale of that school. The committee did, however, think that the time was approaching when they might hope that in some less costly form the Council would recognise the demands that were so frequently heard from their students for separate and more suitable buildings for their art teaching. Proceeding, Mr. Smith asked for the active help of the students and their friends in making known as widely as possible the advantages the branch classes offered. He understood that more than 5,000 pupils became qualified every year to leave the elementary schools in the city. As regarded these pupils, the committee of the School of Art had largely adopted the principle of the open door. Free admissions to the branch schools, which might be held for two years, were offered without competition or examination to all the school-leaving pupils whom their teachers would

recommend. The committee did not expect to get into the branch schools of art all the 5,000, but they would welcome the embarrassment they would temporarily experience if they all came, for that would hasten the day for the provision of the separate buildings they were asking for. The number who came to the branch schools—from 400 to 500 annually—seemed to show either that the offer of the committee was not known to all the pupils until it was too late to ask the head-master of their school for the recommendation, or that too many of the leaving pupils looked upon the end of their elementary school teaching as the completion of their education. These free admissioners became eligible to compete for free places at the central school, and also for scholarships which would enable them to continue their art education there or at Vittoria Street.

Addressing the young students who were present, Mr. Smith said they had shown a desire to take advantage of the privileges offered them, and he advised them to add to the knowledge they obtained by cultivating powers of observation and by serious reading. Many of them were perhaps just ceasing to read books of adventure and fancy. If those books had been well chosen and had brought them into relation with nature, like the tales of Fenimore Cooper or Kipling's jungle stories did, and had not been tales of fancied adventure amongst the criminal classes, their powers of observation would have been properly stimulated. Having finished their books of adventure they would be looking to another type of fiction, and here it was even more important that they should choose wisely, for unless their taste for this fiction was soundly formed at the outset, they would be unable in later life to distinguish between what was good and what was worthless, because it would stifle in them, instead of stimulating, the nobler emotions they had, and which alone could help them to use serviceably and happily the teaching they received. He would advise them to begin this class of fiction with Walter Scott. Let them read "Ivanhoe." There was adventure enough in it and there was also a charming story which maintained its interest throughout. When they had read it they might perhaps be led to visit the beautiful country round Ashby-de-la-Zouch, where the scene of the tournament was laid. Then they should read "Kenilworth," because it

belonged to them. They were not only sons and daughters of Birmingham, but nearly all of them of Warwickshire also, and they should be proud of their county as well as their city. They should learn all they could of its history of the great events which had taken place in it, of the great men who had lived in it, and see all they could of its beautiful scenery. He also advised them to read George Eliot, because she was one of the great writers who were born in Warwickshire, and who knew and described some of its most interesting features. They would also find in her books a way without guidance to the great writers of English prose and poetry, such as Ruskin and Keats, whose knowledge of whose works would certainly be of use to them whether they intended to reach the higher levels of craftsmanship or to follow the professional life.

He recommended that whenever they went into the country they should previously spend half an hour in the library learning something of the history or natural history of the place they were going to visit, and what of especial interest they should look for there. There were few villages or places that could not be connected with some event or some name if they would but take the trouble to learn it. They could not go many miles from Birmingham without feeling the truth of this, and once they acquired the habit of observation they would not only see what they set out for, but would gradually grow to observe all the beautiful things around us. A writer had said that to fully understand the beauty of the dawn one must live in the East. He did not wish to dispute the statement, but a few days after reading it it so chanced that he saw something about the influence of the colder North on the imagination. It was the story of an old Scotchman who was seen standing bareheaded on the seashore at sunrise. Asked why he had removed his hat, he said, "On a morning like this I always salute the glory of the world." In whatever climate we might be born, he believed that this feeling was part of our inheritance, and that it depended very largely on our individual selves whether we hid the talent in a napkin, or whether by using it we made it return to us more than twofold in the added pleasure and joy of our lives.

Mr. Smith then distributed the certificates to the successful students and was afterwards accorded a vote of thanks.

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

AYLESBURY.—Feb. 28.—For public elementary school for 750 children. Premiums 50*l.* and 25*l.* Conditions and plan of site obtainable from Mr. C. G. Watkins, Education Secretary, Aylesbury, on payment of 1*l.* is.

LAMBETH.—March 30.—For municipal buildings at Brixton Hill. Particulars from Mr. H. J. Smith, Town Hall, Kennington, S.E.

NELSON.—March 4.—Designs for a free public library. Premiums of 50*l.*, 25*l.* and 15*l.* Mr. J. H. Baldwick, town clerk, Town Hall, Nelson.

PRESTON.—Feb. 28.—Designs and plans for new elementary school. Premiums of £50, £30 and £20. Plan and conditions from Director of Education, Education Offices, Preston.

WOLVERTON.—Feb. 28.—For public elementary school for 400 girls and 400 infants. Premiums 50*l.* and 25*l.* Also for secondary school to accommodate about 120 boys and girls. No premiums offered. Conditions to be obtained on payment of 1*l.* is. in each case from Mr. C. G. Watkins, Education Office, Aylesbury.

CONTRACTS OPEN.

TRADE NOTES.

HIS MAJESTY'S War Department are using Watson & Co.'s "Reliance" lead and bitumen damp-course for powder magazines, &c., on Plumstead Marshes, an extension of Woolwich Arsenal; the material is easily laid, and is not affected by intense heat or by damp, and is economical. It can be used for vertical as well as horizontal work.

With reference to our illustration in last week's issue of *The Architect* of the new buildings in Great Smith Street Westminster, the electric-power lifts were supplied by Messrs. Archibald Smith & Stevens, of Queen's Road, Battersea. The same firm supplied the two large electric passenger lifts in the vestibule of the Coliseum theatre.

THE War Office are advertising their annual notice inviting those who desire to be placed on the list of firms entitled to tender for army contracts to send in applications to the secretary, stating the particular articles which they manufacture, and the names of at least two well-known firms or public bodies who have purchased from them and are prepared to certify as to the quality of their productions.

THE Brightside Foundry and Engineering Company, Sheffield, have just secured from the Government the order for heating the new War Office buildings in Whitehall. The system to be adopted is low-pressure steam heating, with radiators. The Brightside Company have been Government contractors for many years, and have carried out many important contracts. The work they have at present in hand includes the provision of heating arrangements for Wadsley asylum, Firvale workhouse, Bolton (Lancashire) workhouse, while they have just completed a large water-softening plant and heating apparatus at the Frimley sanatorium, Surrey.

EXPERIMENTS are about to be made with the view of increasing the efficiency of the Bell Rock light. It is understood that a system of incandescent lighting by means of colza oil sprayed on to incandescent burners is to be tried. It is believed that this will greatly increase the power of the flash, and effect a large saving in the amount of oil consumed.

BUILDING AND BUILDERS.

MESSRS. PATMAN & FOTHERINGHAM, LTD., builders, announce that "Mr. A. E. Parker has not had any connection with, or interest in, this firm for some considerable time."

It is proposed to erect new baths in Kingstown, co. Dublin, which will cost 11,000*l.* Other schemes of public improvement are also contemplated, including technical schools at a cost of 5,000*l.*

The students of the second, third and honours stages in building construction at the Birmingham Municipal School of Art last week paid a visit to Sir Alfred Hickman's steel works at Bilston, under the leadership of their lecturer, Mr. Francis B. Andrews, and they were taken round the works and shown the various processes in the production of steel.

The Chairman of the Dublin City and County Permanent Building Society, speaking at the annual meeting, drew attention to the demand for the erection of a larger number of houses worth from 24*l.* to 32*l.* a year. In January the company had out more money than during 1904, which is a fair indication that the building trade was looking up. He recommended builders to turn their attention to that class of house, saying they would have no difficulty in letting or selling them, so long as they did not ask too big a profit.

The President of the Local Government Board has consented to receive a deputation from the Workmen's

National Council and some of the rural district councils on the question of building by-laws. The deputation, which will wait on the President at noon on the 23rd inst., will submit the case for new by-laws, their chief request being that nothing shall be contained in the by-laws to hinder the construction of good cottages. Suggestions will also be made as to the width of roads and on the question of plans.

A SPECIAL committee of the London Chamber of Commerce has examined the County Councils Building Act Amendment Bill with the object of formulating amendments to its provisions, which seriously affect the interests of owners and occupiers of business premises in the county of London. The report of the committee was submitted at the meeting of the Council of the Chamber for approval, the London County Council having invited the Chamber to express an opinion with reference to the Bill. A report on the City of London (Means of Escape from Fire) Bill promoted by the City Corporation, will also be presented.

THE cottages built on the Blackley estate by the Manchester Corporation do not let well. They are a long distance from the city, and the rents, although they have been reduced, are, when coupled with the cost of tram fares, prohibitive to many workers. Very many of the houses are empty, and the present loss is computed at the rate of about 1,500*l.* a year. The sanitary committee have considered various plans for popularising the houses, and they are negotiating with the tramways committee to obtain a reduction of the tram fares between the city and the main road to the estate.

A DEPUTATION, representing the Leeds Trade and Labour Council and the Leeds Labour Representation committee, waited on the Leeds City Council last week to urge that the Corporation should themselves carry out the construction of the new Colsterdale reservoir, instead of giving the work to a contractor. This course was declared to be cheaper, and would to a large extent solve the unemployment problem in the city. When the matter came before the Council the proposal was dismissed. It was declared that municipal officers were not as capable of managing workmen as the contractor who had continual experience, and if the Corporation undertook the work it would be necessary to create a new department of new men unfamiliar with each other.

ELECTRIC NOTES.

A PRIVATE syndicate has been formed with the object of building two 500 horse-power Momentum engines for lighting the Alexandra Palace and grounds. The engine, it may be added, has taken a number of first-class certificates during the past four years that it has been running at the Alexandra Palace, and it has, moreover, been lately patented in Germany.

THE Leith Corporation commenced on Monday the work in connection with the extension of Leith tramway system and the conversion of the system to one of electricity. There is at present sufficient plant at the electric station to provide power during the summer load for the propulsion of a number of cars. It is expected that the extension of the electric station and the additions to the plant will be completed before the next winter load is required.

THE promoters of the West Cumberland Tramways Bill have been informed by a conference of local authorities that they will refrain from giving assent to the Bill unless the extension of two years for the commencement of work specified in clause 3 of the Bill be altered to one year. Sir Douglas Fox & Partners, the engineers to the scheme, have completed detailed specifications and bills of quantities, and tenders have been received for carrying out the work.

THE Blackburn Town Council vigorously discussed last week a proposal by the electricity and tramways committee to make members of the Council wishing to look over the electricity works obtain the consent of the chairman or vice-chairman of the committee, or the town clerk. The proposal was regarded by several members as a blow at the rights of members; but in the end it was approved by a majority of the Council.

THE Light Railway Commissioners, after an inquiry at Grimsby on the 6th inst., approved a scheme for the construction of a light railway from the site of the proposed new dock at Immingham to Grimsby, a distance of about six miles. The estimate for the construction of the line was 74,000*l.* The company have applied for permission to use either steam or horse-power on the line, but it is certain that at the sections beyond docks 5 and 6 steam will be necessary.

THE installation of electricity for the lighting of Bo'ness was inaugurated on Monday. The works, which are estimated to cost about 25,000*l.*, have been constructed by the National Electric Construction Co., Ltd., which have already fitted installations in Oban, Musselburgh and other towns. The power-station is situated about the centre of the burgh, and cables have been laid throughout the town. The light has been running for some months by means of a temporary engine for the lighting of the new library, town hall and infectious diseases hospital.

IN connection with the electrical exhibition at the Battersea town hall a demonstration was given on Saturday last of the Kearney-Thom electric mono-rail system. By this method the carriages are each supported on bogies with wheels placed centrally, and running on one ground rail only, balance being maintained by guide-wheels travelling in a slotted rail held in supports over the vehicles. This slotted rail supplies the current to the dynamos driving the car in the usual way. The merit claimed for the system is its simplicity and its safety, and it is asserted that the highest speeds may be attained. It is proposed to introduce into Parliament next year a Bill to secure powers for constructing a line on this system from London to the Sussex coast.

PROCEEDINGS were commenced at the Surveyors' Institution, Westminster, on Monday, before Mr. L. L. Macassey, sitting as sole arbitrator between the Belfast Tramways Company and the Corporation of that city, arising out of the purchase by the authority of the company's undertaking. The transfer has already taken place, the system having passed over to the Corporation on December 31, 1904. The claim, which amounted to nearly 400,000*l.*, includes an item of 345,971*l.* for the company's undertaking, about 20,000*l.* for two other undertakings, 74,216*l.* three years' unexpired profits and 7,500*l.* compensation to directors, manager and secretary. The full figure was 452,395*l.*, but deducting the amount of the principal moneys secured by the company's outstanding debentures (60,000*l.*) the total claim was 392,395*l.*

THE London, Brighton and South Coast Railway Company's shareholders were informed at the recent general meeting that, after exhaustive and careful inquiry, the

ection of the South London Railway between Battersea Park and Peckham Rye stations had been selected as a convenient piece of line upon which to make an initial trial of electrical working. Mr. Philip Dawson, the electrical engineer advising the Board, with the aid of Major Cardew, one of the directors, had recommended that the overhead conductor system should be used, thus avoiding the dangers which had been experienced with the third-rail system since it had been established. The overhead system involved the introduction of other novel features. If it is proved to be successful the Board will consider and advise the proprietors upon the desirability of extending it on other parts of the Company's suburban system.

VARIETIES.

THE Bury Town Council have sanctioned the erection of filters in connection with the plunge baths at the Corporation baths. The cost will be about 600*l.*, and it is estimated that 54*l.* a year will be saved in the cost of water.

THE Liverpool City Council have been informed that the costs of appeal against the award given in the Rivington arbitration case would be not less than 1,000*l.* instead of 500*l.*, the figure previously stated.

PLANS prepared by Messrs. R. E. W. Berrington & Son, Westminster and Wolverhampton, have been accepted in connection with the sewage schemes for Broadway and Wellington (Salop).

THE Lower House of the Prussian Diet on Tuesday passed the second reading of Paragraph I. of the General Canal Bill, empowering the Government to expend the sum of 334,575,000 marks (16,728,750*l.*) for the construction of waterways.

THE Surveyors' Institution will on Monday resume the discussion on the papers by Mr. A. R. Stenning and Mr. William Menzies, entitled respectively "Urban and Rural By-Laws and suggested Amendments" and "Building By-Laws in Rural Districts."

THE Corporation of London have sealed an agreement with the Ecclesiastical Commissioners for the removal by the latter body, on consideration of the payment to them of

500*l.*, of the two archways at the ends of Duke's Head Passage in the City.

THE Staffordshire County Council have come to an agreement with the Post Office in regard to the question of the erection of telegraph poles along the roads of the county. The terms of the Council that the poles should only be erected subject to the approval of the sites by the county main roads surveyor have been adopted.

THE Local Government Board have urged the Willesden Board of Guardians to obviate the overcrowded state of the workhouse infirmary at Willesden, and the Guardians are accordingly submitting a scheme for an initial expenditure of 20,000*l.* on workhouse blocks and dining-hall for 200 inmates, to form part of an ultimate scheme for 1,000 inmates.

THE Royal Commission on London Traffic and Locomotion held its first sitting after the Christmas recess at the Westminster Palace Hotel on the 2nd inst., and had under consideration the draft report. The Commissioners will sit on several days a week in future until their work is completed.

An action which came before the Lancashire Chancery Court, in which rights of light were involved, has been settled. The arrangement is that the defendant should pay to the plaintiff the sum of 575*l.* and costs between solicitor and client, and that the plaintiff should give the defendant the right to build according to certain plans and sections signed by the architects of the respective parties.

THE Italian Minister of Public Works has published a draft of the proposed scheme for a direct line of railway between Rome and Naples. Hitherto the distance by rail from the capital to the largest city in Italy has been 156 miles; the new railway would reduce it to 131 miles. Only 93½ miles of entirely new line will require to be made, and the total cost of construction is estimated at 2,800,000*l.* The railway will not be electric as was at one time intended.

THE Boston Waterworks Co., Lincolnshire, recently invited tenders for the supply of iron pipes for the duplication of the mains. English firms were easily able to beat their foreign competitors out of the market. The tenders worked out much lower than had been anticipated, but the selected tender, from one of the best of English makers, quoted the pipes at 12*s.* per ton less than the foreign manufacturers offered to supply them for.

At the Manchester town hall Colonel A. G. Durnford, inspector of the Local Government Board, held an inquiry on Friday into the application of the Corporation for sanction to borrow a sum of 100,000*l.* in connection with the erection and equipment of the Municipal School of Technology. Up to January 31, 1905, the total payments made in connection with the equipment and building amounted to 337,564*l.*, and there remained an excess of payments over receipts of 99,021*l.* Of this excess 8,032*l.* was expended in the purchase of land for additional buildings, 38,086*l.* for equipment and 52,902*l.* for building.

AIREDALE WORKS, SHIPLEY.

MANY of our readers will doubtless remember that in July 1903 Messrs. Cundall's Airedale Ironworks at Shipley, Yorks, were completely gutted by fire. This calamity elicited much sympathy, for the substantial and well-equipped stone-built structures then destroyed had replaced buildings which had likewise been burnt down only three years previously. Messrs. Cundall were, however, not to be daunted by this second catastrophe, for on August 12, 1903, a little over a month from the fire, the first sod was turned on a 23-acre estate which they had purchased for the erection of new works. These were put up with commendable promptitude, for in the following January they were in a sufficiently advanced state for occupancy by the firm's workmen. These new works are situated amidst picturesque surroundings on the outskirts of Shipley, bounded on one side by the Leeds and Liverpool Canal and adjacent to the Midland and Great Northern railways, a siding into the works from the former line being in course of construction. The offices are separate from the works, though not many yards intervene. On entering the engineering shop one is at once struck with its dimensions and the activity which prevails. Its length is 400 feet, its width 120 feet and its height 45 feet, the glass roof affording plenty of light in every part of the building. A Vaughan 10-ton electric travelling crane traverses the entire length of the shop, and works with the utmost smoothness and satisfaction. The whole of the workshop plant is also driven by electricity derived from the Shipley Town Council mains, ten motors being employed for driving as many different groups of machines.

The firm, however, will soon be independent of the town supply, for they intend shortly to generate current on their own premises. The building is entirely devoid of galleries and the whole of the tools are therefore on the ground floor. There are over 200 machines employed in the production of component parts of the "Cundall" oil-engine, the "Cundall" folding machine and the "Cundall" patent suction gas-engine and improved suction gas-production plant, the great care taken in the production of even the smallest details and the careful supervision exercised being noticeable in all departments. Crank-turning machines, boring, drilling and planing machines of various sizes and patterns, lathes, keyway cutters, cam-cutting machines, shaping and slotting machines, wheel-cutting machines, milling machines and other costly modern tools cover a very large proportion of the floor space. Many of these tools have been built to Messrs. Cundall's own designs and have cost several hundreds of pounds apiece. The firm have three flywheel turning machines in operation, the face plate of the largest weighing 8 tons. Each engine is tested much above its constant working load before it is passed, and nothing is allowed to leave the works unless it gives complete satisfaction under trial. On the left-hand side of the shop, separated by an expanded-metal screen, is a store for finished parts and workshop requisites, in which there are 2,000 numbered lockers, from which any article desired can be instantly secured after the necessary signed order for its delivery has been obtained from the foreman. A record of the contents of each locker is kept right up to date, and this at a glance shows exactly what stores are in stock. Three Rochester time recorders are employed for registering the time of the 300 men employed in the works, and all water required by the firm is drawn from their own well by a pump just inside the shop door. The foundry is situated at the end of the building, being suitably screened off from the remainder of the shop. This department is also well equipped, its two furnaces being of 5 tons and 20 tons capacity respectively, the necessary blast being furnished by an electrically-operated fan. Casting takes place at least once a day and sometimes twice. The blacksmith's department is located in one corner of the foundry. Leaving the main building you enter the pattern

which is a separate building 90 feet square. This has been wholly equipped with new plant, and affords employment for several men, whilst at one side of it, partitioned off, is the comfortable and quiet drawing room. Running alongside of this building is the Leeds and Liverpool Canal.

Messrs. R. Cundall & Sons have devoted great attention to the perfecting of an engine of the suction gas type, with the result that they have been able to place on the market the "Cundall" patent suction gas-engine of improved suction gas-producer plant, the success of which has surpassed their most sanguine expectations, and they anticipated that when users of power become cognizant of the vast economy in the production of power which is effected by their use, the demand will become enormous. These engines important valuable patents have been secured, and so successful have they proved that in this branch of business tenders have been accepted for engines amounting to some thousands of horse-power. They have an engine and plant of 175 b.h.p. which can be seen running their works, and they will be only too pleased to intending purchasers to visit Airedale Ironworks, where they will be able to see engines of all sizes in the course of manufacture. Amongst the large number of orders this firm have in hand we understand they have secured the contract for the East Cowes Urban District Council for an engine and plant of 50 b.h.p.

THE BURNING OF "THE GLEN."

A fire at "The Glen," Sir Charles Tennant's residence in Leicestershire, has reduced one of the finest mansions in Scotland to practically a roofless ruin. The western wing, which did not form part of the original plan, has been spared by the flames, but the damage there by water and smoke could hardly have been greater had the fire been allowed to complete its work of destruction. With this exception, and possibly a small portion of the eastern wing, where the roof remains, the mansion is in ruins. Little is left, says the *Scotsman*, but the charred walls and gaunt gables.

Built in 1855, "The Glen" is a fine specimen of the work of the late David Bryce, who acquired a high reputa-

tion in the domain of Domestic architecture. Scottish Baronial in style, the house lies east and west, and is flanked by wings of loftier elevation. The eastern wing is surmounted by a high tower and soaring flagstaff. The flagstaff, although it is situated right above the spot where the fire was hottest, remains curiously in its place unharmed. The main building consists of three storeys and a semi-sunk flat, while the wings are four storeys in height, and are diversified by the numerous quaint turrets, crow-foot gables and gargoyles which are a feature of that style of architecture. The main entrance to the house is situated in the north of the eastern wing, which is of a castellated character. Above the doorway, raised a few steps above the level of the ground, there is a panel containing a coat-of-arms and the motto, "Deus Dabit Vela." Below the coat-of-arms are two smaller panels, one bearing the words, "Blissit be God in all His giftis," and the other, "They are welcome here what the Lord do feir." The doorway, with its ivy still clustering at one side, leads into a small hall, to the left of which is the service portion of the house; while on the right there is the main hall, a spacious oak-lined apartment, which also serves as a billiard-room and reception-room. This hall and the grand staircase leading to the guest bedrooms, and to the servants' bedrooms above, are in the main building. The latter is surmounted by four dormer windows, from one of which, lighting a servant's bedroom, the fire was first discovered. From the south side of the main entrance hall, access is obtained to the library, the dining-room, the drawing-room and the business-room, or smoke-room, as it was sometimes called. The drawing-room was a magnificent apartment with a lovely prospect to the south, and occupying all the length of the west wing and a portion of the main building. It was splendidly appointed. The roof was richly moulded in heavily gilded plaster-work, while the walls were upholstered in silk, with gilded panelling at intervals. Although the flames have broken through only a portion of the roof, the remainder is hopelessly ruined by water, which on Saturday continued to drip in a melancholy monotonous fashion on to the sodden carpet below. It was in this room and in the library that the finest pictures were hung. Above the fireplace of the drawing-room there was a very valuable Etty. The other

pictures included examples of Gainsborough, Erskine Nicol, Newbank, Linnell, Roberts, Fred Walker and David Cox. In the library there were hung Colvin Smith's picture of Sir Walter Scott, a Morland landscape and a very valuable set of illustrations by Sam Bough. A fine collection of Worcester china also formed part of the furnishing of the drawing-room, and this, like the pictures and the beautiful French furniture, was all saved.

The southern part of the house being to the leeward, it has suffered most from the fire. The library, which was also a handsome and notable room, apart even from its contents, is now filled with debris and charred beams. It was fortunate in some respects, that the fire occurred in the upper portion of the house, because there was thus time for the employees to clear out the contents of the lower flats, which contained the most of the valuables. The south front, which faces the Fethan Wood, possesses a fine double staircase leading from the house to the lawn. A large portion of the balustrade has been destroyed.

SOCIETY OF ENGINEERS.

The first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 6, at the Royal United Service Institution, Whitehall. Mr. D. B. Butler, the president for 1904, first occupied the chair and presented the premiums awarded for papers read during that year, viz. The President's gold medal to Mr. William Edward Storey for his paper on "Condensing Machinery," the Bessemer premium of books to Mr. R. G. Allanson-Winn for his paper on "Deep-Sea Erosion and Foreshore Protection," a Society's premium of books to Mr. A. S. E. Ackermann for his paper on "British and American Coal-cutting Machines," and a Society's premium of books to Mr. Frank Latham for his paper on "Some Recent Works of Water Supply at Penzance."

The thanks of the Society were also accorded to Mr. H. C. H. Shenton for his paper on "The Latest Practice in Sewage Disposal," to Mr. Percy G. Scott for his paper on "Railway Surveys and Design in New Countries," to Mr. James Thame for his paper on "Recent Developments in Crushing and Concentrating Machines," and to Mr. Perry F.

Nursey, past-president and secretary, for his "Ju Retrospect," being a brief history of the Society from inception to date.

Mr. Butler then introduced the President for the present year, Mr. Nicholas James West, to the meeting, and received from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year.

The President, in his inaugural address, commenced by thanking the members for placing him in the presidential chair; and he expressed the hope that when his term of office was concluded it would be felt that he had discharged the duties of his office with honesty of purpose, and furthered the interests of the Society as far as his ability and time allowed him. He then referred to the circumstance that the Society held its jubilee last year, observed that having been in existence so long (over half a century), pursuing its successful and beneficial work year by year, clearly showed the close application and watchful attention to its interests of its past Presidents, members of Council and officers, and accounted for its present satisfactory position, both numerically and financially.

In his address the President dealt mainly with the mechanical side of engineering, with reference to the historical use and improvement of, pumping and marine engines, and the application of the latter at various periods to vessels of different kinds, and he included a reference to the latest phase of turbine propulsion.

The address was listened to with marked attention by a large and appreciative audience, and at its close a hearty vote of thanks was accorded to the President.

AMERICAN WOOD-WORKING MACHINERY.

In his report on iron and steel exhibits at the St. Louis Exhibition, Mr. E. Seymour Bell, British commercial agent in the United States, when describing machinery says that one American company show some thirty-five modern wood-working machines of latest design and embodying improvements. The special features of the exhibit are fast-feed flooring machine, fast running and leaving a good finish; a 10-inch outside moulder with an extra heating table; a triple sandpapering machine. This last machine

WILLIAM GREEN & CO. (Ecclesfield), Ltd., ECCLESFIELD, near SHEFFIELD

of interest. The drums are placed on the top, which imitates the changing of papers and the carrying off of articles. It has an endless bed instead of roller feed, which is designed to be novel and advantageous. The bed is furnished with rubber slips to increase the friction. There is also a double end tenoner for furniture and general work with special attachment for tenoning thin stock. There is another attachment for cutting moulding on table tops. There is also a complete exhibit of thirty-two wood-working machines, including planers, surfacers, moulders, saws, mortisers and shaping machines. The most notable are a two-piece dimension planer, double ender and matching machine with adjustments and facilities for working on small as well as large material. It will take in material up to 30 inches wide and 8 inches thick. It is furnished with four changes of feed, 45, 60, 70 and 80 lineal feet per minute. It is a heavy and serviceable machine. A double surfacer 30 inches wide, 8 inches thick. A strong and powerful machine suitable for heavy work. A four roll surfacer and matcher, 18 inches wide by 6 inches thick. A 15-inch inside moulder by 6 inches thick. Taken altogether, the iron and steel exhibits are decidedly interesting, and, from an American point of view, an excellent advertisement. That British manufacturers have not availed themselves to a greater extent of this great opportunity of advertising their goods must be a matter of regret to those who have their interests at heart. If French and German manufacturers are satisfied that it is worth their while to send their products, it ought to have been much more so for those from the United Kingdom. The fact that the high tariff is prohibitive, though true to a certain extent, does not apply in all cases. Taking one instance, cutlery. The importation of knives in 1903 showed an increase of 13 per cent. over that of 1902, though the average duty paid was 78.19 per cent. *ad valorem*. Razors increased 21 per cent., the duty averaging 54.76 per cent. *ad valorem*. Scissors increased 27 per cent., the duty averaging 51.50 per cent. *ad valorem*. Other cases might be cited, but cutlery has been taken because the imports from some other countries of certain articles have increased at a more rapid rate than those from the United Kingdom. It must be remembered, again, that in sending exhibits to an exhibition like that of St. Louis it is an advertisement to

the whole world. Visitors from South America and other countries, of which there are immense numbers, look for articles they require; and not only for new ideas. When they see what they want made in America, Germany, France and others, they naturally buy from them in preference to the United Kingdom, whose manufactures they cannot see. It appears too much to the visitors as though British manufacturers had given up the fight in favour of other countries. The uninformed look upon it as a sign of weakness, while other countries make the most of their opportunities and encourage buyers in their belief.

That orders are not always looked after by British manufacturers as they might be is instanced by a conversation the writer had with a representative of an American concern working under British patents. This representative declared that he had received personal inquiries from visitors from Europe for some of their manufactures. He had to refer them to the British house, who are unrepresented at the exhibition, as his company is prohibited from selling in Europe. This is merely quoted to show how easily orders may be lost when a comparatively small outlay would show the goods to the world.

STEEL STRUCTURES IN BERLIN.

The United States Consul-General at Berlin, Mr. Frank H. Mason, in his report says:—

Some weeks ago the Central Association of German Industrials addressed to the ministry of the interior a respectful and exceedingly well written memorial urging that the present building laws, which do not permit the construction in Berlin of dwellings or business buildings with a greater height from pavement to cornice than 22 metres (72.18 feet), be so far relaxed as to allow steel-framed buildings of higher altitude to be erected, if not generally, at least in exceptional cases when good reason for such variation could be adduced.

The reasons for the proposed innovation, as set forth in the memorial, were that the rapid growth of Berlin in population and business interests required more room to be provided, particularly in the central districts, without increase of cost to tenants; that the restriction to a limit of

four storeys compelled excessive lateral expansion that had already spread the city over an immense area, and thus lengthened the distance between the homes of many people and their work; and that experience in other countries had shown high steel-framed buildings, when properly constructed, to be safe, comfortable, uniformly better lighted and ventilated, and therefore more sanitary for dwellers and working people than those of ordinary height. Furthermore, it was urged that such a relaxation of building regulations would bring into use great quantities of structural steel and iron which are now largely produced in Germany, and for which an increased market would be highly appreciated by the steel and iron-masters, who are making such a brave fight for a share in the world's trade.

Thus plausibly stated, the appeal of the industrial association was submitted during the summer vacation to the ministers of commerce, the interior and public works, who, after due consideration, made a joint reply, dated September 20, in which the petition was flatly refused, for reasons which were stated at length, but may be condensed as follows:—

1. The ministries are opposed to any system of building which will lead to an increase in the number of "renting barracks" (Miethscaserne), large buildings divided into a great number of small apartments or tenements, which are leased to families of working people, with the result that a great number of persons of both sexes and all ages are huddled together under conditions which are necessarily subversive of normal family life and prejudicial to public morals.

2. Buildings so high as to be beyond the level of the present water supply could not be made clean and sanitary.

3. Any important increase in height beyond the present limit would put the upper storeys of the buildings beyond the protection of the fire department, as at present equipped and organised. Whatever might be the material interests involved, the ministries held themselves bound to consider and protect not only the architectural unity and beauty of the city, but the health and the moral and physical safety of the people, all of which would, in their opinion, be compromised by the proposed innovation.

With this result the authors of the petition are by no means satisfied, and have replied that they had not proposed

to carry buildings in Berlin to the excessive heights which are common in the United States, and that had the desired permission been granted, it would have been provided with careful and competent engineering that all the requirements of fire protection, water supply and every sanitary necessity should be carefully and completely met. Moreover, regard to resistance to conflagration, at Baltimore the steel-framed buildings, which offer least food for a fire, have vindicated their superior safety and were left standing monuments amid the wide waste of the ruins of the old and five-storey blocks built of stone and brick in the ordinary way.

Thus the discussion stands at present, and it does not appear likely that the ministries, fortified as they are by considerations of municipal beauty and public health and safety, will recede from their present position. It is difficult to persuade German conservatism, in so important a matter as the architectural construction of cities, with arguments drawn from experience in a country which, like our own, has paid during the past twenty-five years an average annual tribute of 125,000,000 dols. to the scourge of fire, and which for the losses of the current year 1904 must pay nearly or quite double that sum. However little of our annual holocaust the "skyscraper" may be responsible for, the fact that it is a distinctively American type of construction will not recommend it to European municipalities.

IMPROVEMENT OF ROADS.

A PAPER was read by the Lord Justice-Clerk before the Royal Scottish Society of Arts on "Roads: what they are and what they should be." He said the truth was only now being recognised that roads should be made good for traffic, and not by it. There was no doubt that the road of to-day was a way of luxury compared to what that of bygone times was. Even in the middle of the eighteenth century the use of wheeled vehicles for long distances was very meagre and it was only in 1820 that the cabriolet, now shortened into "cab," was introduced from France. Just as now France was the country which introduced the power carriage to us. Of these cabriolets it was written at the time "They rush about the streets as rapid as fireflies," and the

J. B. ORR & CO., Ltd.,
CHARLTON, LONDON, S.E.

After added words which might well be held prophetic of the days of the autocar:—"They lame few, they kill fewer, they sometimes overrun us, but their serious damage is not such." As the improved vehicles of the latter half of the 19th century made their way, there was an awakening in the national mind, and the thought arose that it would be well to provide good roads so as to obtain the best benefits from the progress of the genius of Macadam and his carriages. Accordingly the contemporaries abroad, led to a complete transformation of the road, by which its value for passengers and goods traffic was increased in manifold degree, and an incalculable contribution was made to the national prosperity. Then came the day of the railroad, an invention which brought increased social and commercial advantages, but had one great effect for evil, for it checked, and indeed practically killed, the progress of good road making. There were signs now that the public mind was awakening once more to the fact that there was a great future for road traffic, and that good roads were a most valuable national asset. The rapid development of power traction, consequent on the invention of the explosion motor, had made it plain that in the immediate future the distances which could be traversed conveniently and economically by road would be trebled or even quadrupled, that cheap and rapid access to markets by the highway would be greatly increased, and that pleasure driving would open up roads and put a smiling face on desolate country sides and revive the prosperity of the roadside inns, which the abolition of coaching was believed to have permanently ruined. A good road should be smooth, easily kept clean, free from railway lines, durable, having a surface contributing as little as possible to noisiness, free from dust and mud, and last but not least, it should be of such a make that it could be repaired piecemeal, so as to be kept in good repair at all times, and not as at present only to be repaired either by blocking the traffic for weeks at a time, or by compelling the vehicles to go over a bed of sharp stones. Dealing with wood pavement, he said that quietness was its only recommendation, and he thought it must be condemned as decidedly insanitary, and, further, not capable of any repair otherwise than by breaking it all up, which meant, of course, that it must get to its worst before it was

dealt with. To use a material which must fray and take a brush face, which face was liable to rot when soaked in water, and to use it in circumstances in which it must always have spread over it a film of insanitary filth, could not be a sound device for making the roads which passed through places densely crowded with human beings. If anyone would go on a day in dry weather and look carefully at the roadway in Princes Street, he would see that the filth of the traffic was caked down and holding to the perishing surface, so that no sweeping would remove it. And of course when the surface became depressed every here and there into saucer-like dimples, ultimately exhibiting large patches where the surface, rotted by moisture, had scaled off, the evil must become much greater from water lodging in these hollows and causing increased decomposition. If asked what he would substitute for wood, he unhesitatingly said Val de Travers asphalt. With it an absolutely smooth surface was got, capable of being kept free from all insanitary filth, and possessing the great advantage that repairs could be made bit by bit, and that it was impervious to moisture, that insidious enemy of roads. As regarded the laying of streets with stone setts, two conditions should be satisfied—(1) that the stones rested on an absolutely dry bed, and (2) that they should be set and packed so that no moisture, however slight, would penetrate the bed in wet weather. Finally, he came to the ordinary road of the country, which was identified with the name of Macadam. But the macadam road, great improvement as it was, had shown itself to be by no means a perfect device. In moderate weather, neither too wet nor too dry, it gave a really good road, of which no one could reasonably complain. But whenever the weather became decidedly dry or decidedly wet, deterioration set in, making the traveller a sufferer and causing the haulage animals to suffer also, and as a consequence causing commercial loss by the slow rate of transit, and further loss by the deterioration of horse-flesh and of vehicles. He thought the credit must be credited to Mr. Hooley, the road surveyor of Nottinghamshire, of having succeeded in finding in his tar macadam what, if not a final solution of the difficulties, was a present solution of great value, and which, though it might be improved upon, would have a permanent in-

fluence for the future. Good main roads were a matter of national concern for universal accommodation, for commercial prosperity and for national defence, and some general system and general authority were the only true solution of the road problem. And he made bold to say that it would be a very wise policy for the Government to establish a Commission to examine the roads and determine what improvements were called for, and to find the money liberally for making the road system more efficient, thus enabling the great work to be done promptly, and spreading the expense over a period of years. It would add greatly to the prosperity of the country if a sum of five or six millions sterling was given out in loan for systematic road improvement; and he said of all road improvement, both in engineering and in laying streets and roads with the best road bottom and road surface that the circumstances in each case made advantageous, it would be found to be true that what seemed expensive was the cheapest in the end. The national mind had slumbered on the road question for two generations, foolishly believing that the establishment of railways made roads of little importance. But there was now an awakening. The road was once more to resume its place as one of the great factors in the national welfare. Every month that passed would see the road traffic both for commerce and for pleasure steadily increasing, and that road improvement might develop in corresponding proportion should be the wish of every good citizen both for his own comfort and for the national prosperity.

LONDON BUILDING ACTS (AMENDMENT) BILL.

A CONFERENCE of representatives of the City Corporation and of the metropolitan borough councils was held at the Westminster Palace Hotel on Monday to consider the London Building Acts (Amendment) Bill. The only Council which declined to take any part in the conference was that of the borough of Chelsea. Mr. P. G. Gates, mayor of Kensington, was appointed chairman, and Mr. W. Chambers Leete, town clerk of Kensington, hon. secretary.

Major L. H. Isaacs (Kensington), in the course of an explanation of the Bill, said it proposed to increase quite unnecessarily, he thought, in a great number of cases, the

minimum width of new streets from 40 feet to 50 feet, and to require an even greater width than 50 feet in certain cases. By clause 17 lanes and ways were to be widened when required, to 50 feet without any compensation being paid for the extra land so taken. It was proposed also to give the private rights in forecourts and spaces not separated from the roadway by fences or walls and not dedicated to the public should be acquired for the public benefit without payment. Other provisions to enable the County Council to require streets, to be widened from 40 feet to 70 feet, the surrender of land by the owners on each side who might desire to build upon frontages not already occupied, and cases where they considered any street likely to become an important highway to define a general line of building, and to set such line as far back as 75 feet from the existing centre of the highway. He moved a resolution, which was unanimously adopted, to the effect that the provisions of the Bill were of such a drastic and complex character, and passed into law would be found so unintelligible and unworkable, that it was desirable that the Bill should be withdrawn or opposed.

It was also resolved that a new Building Act, codifying the present Acts, with such amendments as may be found desirable, should be formulated after the matter has been considered by a Royal Commission, and that, before the Bill is drafted, the views of the London County Council, the Corporation of the City of London, the councils of the City of Westminster and the several metropolitan boroughs, and the various professional associations connected with building work should be ascertained and considered. Another resolution was carried declaring that in any new measure the London County Council should be relieved as much as possible by transferring to the City and borough councils all duties that can be efficiently discharged by those bodies in accordance with the views expressed by the Royal Commission in 1894. A number of consequential resolutions were passed, including one authorising copies of the main resolutions to be forwarded to the Prime Minister and the President of the Local Government Board, with a request that the necessary steps might be taken for the appointment of the suggested Royal Commission, and another requesting the County Council not to proceed with their Bill in the ensuing session.

Fires in Historic Mansions.

The Nation's Interest demands better Protection from Fire

Who can replace the ancient and venerable traditions of the various mansions recently destroyed—the triumph of painting, sculpture, plate, or jewellery—their association and record of the master hand that created them?

NOTHING BETTER THAN THE BEST.

THE BEST FORM OF FIREPROOF CONSTRUCTION IS OBTAINED BY THE

"DOVETAIL CORRUGATED" SYSTEM

WHICH MEANS IMMUNITY FROM DESTRUCTION.

FIRE TEST.

READ THIS: Re Fire at Messrs. CABINS (Ltd.) RESTAURANT, No. 198 Oxford Street, W. (March, 1904).

"DEAR SIRS.—In response to your request, I have pleasure in testifying to the Fireproof qualities of your "Dovetail Corrugated" partitions as exemplified in the fire which occurred recently at this building. Notwithstanding the great heat and the extreme test to which they were subjected the partitions have remained intact, and thus kept the emergency exit required by the London County Council uninjured, and no doubt the partitions very materially helped to save the rest of the building."

"TO THE FIREPROOF COMPANY, Ltd., 10 York Buildings, Adelphi, W.C.

The above is copy of Architect's testimonial as to the Fireproof Qualities of our Partitions as tested by actual experience. Used at WEASENHAM HALL, (Earl of Leicester), CURZON STREET, MAYFAIR (Earl Howe), MARLBOROUGH HOUSE (H.R.H. Prince of Wales), WINDSOR CASTLE, &c. (Space prohibits longer list.)

FIREPROOF CONSTRUCTION IS OUR SPECIAL BUSINESS, AND OUR EXPERIENCE IS AT YOUR DISPOSAL.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE

TO THE

ARCHITECTS & CIVIL ENGINEERS OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO.
becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

THE Brightside Foundry and Engineering Company, Ltd., have secured the contract from H.M. Government for heating the new War Offices in Whitehall. The system is to be low-pressure steam heating with radiators. The company have just completed a large contract for water softening plant and for heating apparatus at the Three Counties Asylum, near Hitchin, and also at the new Sanatorium at Frimley, Surrey, which was opened lately by H.R.H. the Prince of Wales. They have erected many heating apparatus for H.M. Office of Works, India Office, Metropolitan Asylums Board, London County Council (education department), and are at present engaged on several similar large works, viz. Wadsley Asylum, near Sheffield, Fir Vale Workhouse, near Sheffield, Bolton, &c.

BUILDING AND BUILDERS.

THE sandhills at Hawthornden, near Edinburgh, extending to over 30 acres, have now been opened up, and the supply of sand for building purposes is practically inexhaustible.

THE Yorkshire Master Painters' Federation held their annual meeting and exhibition at Halifax. The report declared there were signs of a general improvement in business. The next meeting in 1906 will take place at Hull.

THE harbour committee of Kirkcaldy Town Council considered last week the tenders for the extension of the East Pier, being the first portion of the new harbour works. About twenty estimates were received, only one being from a local contractor. The estimates ranged from 24,000*l.* to 50,000*l.* After consideration, it was agreed to submit the whole of the estimates to the engineer, and secure his report before accepting any of the offers.

THE Kroonstad Town Council, South Africa, recently considered a report of the public works committee on plans by Messrs. Leech & Mackay, architects, Johannesburg, which were provisionally accepted. The committee estimated the cost of erection at 14,500*l.* The Council resolved to reject these plans as largely in excess of the amount allowed by the ratepayers. Another firm of architects are to be requested to draw up plans at a lower cost.

THE West Lancashire Rural District Council, which has jurisdiction over seventeen townships, were informed by the chief surveyor that a washhouse at Rufford had been erected without the previous submission of a plan and without proper drainage. The surveyor added that he would have two or three cases of a similar nature for the next meeting. Many of the members having expressed dissatisfaction with the by-laws, it was decided not to take proceedings against the owner of the washhouse.

A LIGHTHOUSE is about to be built in the open sea, at distance of about 22 miles from the mainland, off Cap Hatteras, on the coast of North Carolina. The projected lighthouse will be built entirely of steel. It will contain accommodation for two families of lighthouse keepers, rooms for storing food, the necessary lighting appliances and machinery, and a powerful steam-driven siren. Moreover, the lighthouse will be fitted with wireless telegraphy, and connected by telephone with the land.

MR. GEORGE TYRRELL, Government contractor, died at Yarmouth on the 10th inst. at the age of eighty-four. He constructed the Bembridge forts, the forts between Plymouth and Plympton, and reconstructed the Royal Naval Hospital at Yarmouth. He had also built Tenby and Calder lighthouses and restored the Haisborough lighthouse. Mr. Tyrrell carried out the big works at Hurst Castle, but they led to long and costly arbitration, in which Mr. Tyrrell spent a fortune. Since then he had covered estates with houses at Yarmouth.

VICTORIA public school, Govanhill, Glasgow, which will accommodate 1,236 pupils, has been opened. The exterior is of red sandstone. Besides the usual classrooms, there is a cookery-room and a workshop. On the ground floor there are six classrooms for 396 infants, and there are fourteen classrooms on the upper floor, accommodating 840 children. The workshop and cookery-room form a separate block. The Plenum system of heating has been adopted, and electric lighting has been fitted up throughout. The estimated cost of the school, including equipment, is 20,000*l.* Mr. Andrew Balfour was the architect.

SIR JOHN JACKSON, the contractor for the extension of Devonport dockyard, in supporting an application for a license for a trust public-house on an estate owned by him

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS COMBINING LENSES AND PRISMS.

DARK INTERIORS

MADE LIGHT.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

MAXIMUM LIGHT GLASS -

Is supplied in sheets for glazing like ordinary window glass.

Also in ornamental patterns glazed in lead.

And in crystal tiles framed in copper.

ELECTRIC NOTES.

THE experiments made of lighting the South Quays, Antwerp, with electricity have proved so satisfactory that the Chamber of Commerce are urging that electricity should be extended to all sections of the quays and docks.

THE electric railway going completely round the base of Vesuvius has been completed. Tourists in Naples will be able to reach Pompeii by frequent trains for 1s. 3d., compared with the railway fare of 3s. 7d.

THE Wakefield City Council on the 14th inst. resolved to make application to the Local Government Board for sanction to borrow 18,000*l.* for extending the electrical undertaking.

THE fact that special rules have been prepared for the installation and use of electricity in coal mines is significant of the progress which the new form of power and lighting is making in the collieries of this country. A code has been agreed upon and will shortly be proposed for establishment in collieries.

A PETITION has been lodged against the Croydon Corporation Bill for the extension of tramways to Upper Norwood. It is signed by owners and frontagers who object to the proposed expenditure of 130,000*l.* The present debt of Croydon is more than two millions, the rates have risen from 5s. to 7s., and it is contended by the petitioners that the proposed scheme cannot even pay working expenses.

THE electric-lighting committee of the Edinburgh Town Council have received a report by Mr. F. Newington, the engineer, advising the department to undertake the testing of incandescent lamps in use by consumers. Lamps of an inferior make have, it is said, been largely used, the light being below their stated capacity and below the consumpt. It is proposed that lamps should be sent by wiring contractors to the department and tested at a charge of 6*d.* per dozen.

THE Stourbridge Guardians are still unable to settle the question of the lighting of the new workhouse by gas or electricity. Mr. A. Marshall, architect, submitted estimates, and these were 2,700*l.* for electric fittings and 2,139*l.* for gas fittings for the workhouse. The price for electric lighting

and on which his workmen reside, mentioned an experience which influenced him in resolving to allow facilities for obtaining intoxicants. He said that twenty years ago he employed many hundreds of men in constructing the Manchester Ship Canal, and he then absolutely prohibited the sale of drink within his boundaries. A great deal of drunkenness was, however, found in the temporary houses on the works, and for a long time he was at a loss as to the cause of it. Within a few months of the completion of the canal it was discovered that in one of the huts near Runcorn the miners had burrowed down longitudinally for 100 to 150 yards to the high road, and through that tunnel drink was brought during the night in barrels, while the watchmen knew nothing about it.

THE Tramways and Light Railways Association paid a visit last week to the works of the London United Electric Tramways at Chiswick, under the guidance of Mr. Clifton Robinson, the managing director of the company. The power there produced is supplied to the sub-stations at Fulwell, Hounslow and Hanwell, and meets all the requirements of the twenty-seven miles of tramway which are worked by the company. The most noteworthy objects are the eleven Babcock & Wilcox boilers, the steel chimney 260 feet high, the model engine-house with its complete generating plant, which has been described by American and other experts as the best arranged and most economically designed department of the kind that they had seen; the Wheeler condensers and the auxiliary electric plant.

would be 3d. per Board of Trade unit, and 2s. per 1,000 for gas if a minimum of 3,000,000 feet were consumed yearly. Further information is to be obtained before the matter is settled.

THE Electrical Contractors' Association at a general meeting determined to prevent by every legitimate means the passage of Clauses 63 and 64 of the London County Council General Powers Bill being promoted in Parliament this session. The clauses seek to authorise any metropolitan borough council supplying electrical energy to expend money on "wiring and fitting and supplying with wires, fittings, and apparatus the premises of their consumers or prospective consumers."

THE Cheltenham Corporation recently applied for sanction to a further loan of 2,000l., for the purchase of additional plant to supply motor power for the six miles of tramway extension shortly to be opened for traffic. At the inquiry on the 3rd inst. the town clerk explained that since the application was forwarded to the Board, tenders had been received and provisional contracts entered into under which the required plant would be obtained for 1,482l., and he therefore asked for a reduction in the amount of the proposed loan to 1,500l.

THE Wolverhampton tramways committee have for some time had under consideration the question of laying down an electric tramway from the centre of the town to the Penn district, but they have come to the conclusion that, owing to the narrowness of the roads and the heavy expense, it would be better to place a service of motor omnibuses on the roads. It is recommended that tenders be obtained for three double-deck petrol omnibuses at a cost of about 950l. per 'bus.

THE Dunfermline Town Council have adopted the following motion:—"That the Town Council, as local authority for the burgh under the Electric Lighting Acts, resolve to apply to the Board of Trade for a provisional order authorising them to supply electricity within the burgh for lighting and power purposes, including public lighting, and under which they would become authorised distributors within the meaning of the Fife Electric Power Company's Act of Parliament; and that the town clerk, in conjunction and with the assistance of Messrs. A. & W.

Beveridge, parliamentary agents, London, be instructed to take all necessary steps with that view."

THE Belfast Corporation have succeeded in arranging a loan of 1,000,000l., in connection with the tramway undertaking, with the Union and Smith's Bank, Limited, London. The rate of interest will be 3½ per cent., and the stock is to be issued at 98 per cent., with an underwriting commission of 1 per cent. The issue, it is understood, will be offered very shortly to the public, and any portion not subscribed will be taken up by the Union Bank at the price of 97l. per 100l. These terms are regarded as very favourable considering the state of the money market, and may be taken as an indication of the soundness of Belfast municipal credit.

VARIETIES.

THE Aston Town Council have sanctioned the reconstruction of certain tramways at a cost of 63,270l., inclusive of overhead equipment.

At the annual meeting of the City Offices Co., Ltd., the directors reported that the rebuilding of Baltic House, Leadenhall Street, E.C., by Messrs. Patman & Fotheringham, Ltd., is making good progress.

It is taken as a proof of the improvement of trade at Haslingden that this year, when the renewal of dog licenses was due, not a single dog was sent to the borough lethal chamber to be killed. Usually there are a large number.

A PAPER entitled "The Queen Victoria Memorial as compared with other Royal Memorials Abroad" will be read by Mr. M. H. Spielmann before the Society of Arts on Tuesday, the 21st inst.

A DEPUTATION of the Newcastle-on-Tyne Town Council, accompanied by the city architect, Mr. F. H. Holford, inspected on the 10th inst. the model one-room dwelling at the People's Palace, Glasgow. A similar plan will probably be recommended for adoption in Newcastle.

A SERIOUS drainage difficulty has led to the closing temporarily of Nantwich parish church. In consequence of the stoppage of an old drain a leakage has occurred in the church and a most objectionable nuisance has been caused, which prevented its use for public service on Sunday last.

THE Lincoln City Council at their last meeting considered designs submitted by Messrs. Doulton & Co., Ltd., for proposed picture tile panels at the hospital, and it was resolved that the design, "The Finding of Moses," be selected, the cost of the panel, 4 feet by 2 feet 6 inches, with a 6-inch margin, being 20*l*.

THE directors of the Vulcan Boiler and General Insurance Company, of King Street, Manchester, are arranging with the authorities of the Manchester University the establishment of a Fellowship for study and research in engineering. This is stated to be the first instance of such a step having been taken by any firm.

THE Kensington Borough Council have decided to remove from the Public Library rate the limitation of a halfpenny in the pound in order that a new central library might be built at an estimated cost of about 17,000*l*. Kensington is the only library authority in London which has been until now limited to a halfpenny rate.

SEVERAL of the valuable sites forming the upper parts of the stations of the Central London Railway have recently been let upon building leases. The superstructures over Chancery Lane and Tottenham Court Road stations are now being constructed from the designs of Mr. Delissa Joseph, who was also the architect of the superstructure over the Post Office station.

THE contracts for the contemplated reconstruction of the Kelso town hall have been let, and the work is to be proceeded with at once. The scheme of renovation includes the refacing of the stonework of the building, and converting the piazza on the street level into a court-room and offices. A loan is to be obtained for 3,000*l*. for the carrying out of the work.

THE report of the Guinness Trust for the past year states that the average weekly rent of each room was 2*s*. 1*½**d*., covering chimney-sweepings and the use of venetian blinds, common room, baths and hot-water supplies. The rent is also inclusive of all rates. The trustees have now provided 2,574 separate dwellings containing 5,339 rooms, besides laundries, club rooms, costers' sheds and perambulator sheds.

THE Compania Fundidora de Fierro y Acero of Monterrey, Mexico, are now building coke ovens at the immense

steel plant of the company in that city. The foundations for sixty of these ovens have already been laid, and it is stated that they will be in operation within four months. In the near future it is proposed to build sixty more ovens, which will enable the company not only to supply its own needs, but also to place its coke on the market.

THE Local Government Board have given their approval to the scheme for rehousing persons who had been displaced in various parts of Sheffield owing to street improvements. They have sanctioned the borrowing of 23,000*l*., which is to cover the cost of land in Clough Road and Edmund Road, and seventy houses to be erected thereon. The city surveyor was instructed to prepare specifications and invite tenders for the work.

THE Belfast public health committee have adopted a scheme of offering prizes for cleanliness to occupiers of small houses, the rent of which does not exceed 4*s*. weekly. The prizes consist of allowances to cover the rent for specified periods, and these will be awarded to the competitors who keep their houses, yards and premises, including furniture, utensils and windows, cleanest and in the most sanitary condition between certain given dates.

A CONFERENCE attended by landowners and farmers of West Wales has been held at Carmarthen, when the afforestation of the waste and unproductive woodlands of Wales was discussed. It was declared that if the general planting of 10,000,000 acres out of 21,000,000 acres of waste and unproductive woodland in the United Kingdom could be promoted a saving of from 8 to 10 millions annually would be effected in the course of years, as we now paid 30 millions sterling to foreign countries for our timber supply.

THE Shakespeare Memorial provisional committee say, in the course of their statement, if the response is adequate, it is hoped that there may be erected in London a Shakespeare house or institute, with a Shakespeare library, a lecture theatre and a central hall to receive a fitting statue of Shakespeare, statues of other famous men being added from time to time. To carry out this suggestion large funds will be necessary.

THE Carmarthen County Council are obtaining the opinion of similar bodies on the following resolution:—"That County Councils endeavour to obtain such legislative

That property shall comprise such appurtenances as will obviate the (either temporary or permanent) deposit of any matter constituting an obstruction or nuisance."

THREE Bills relating to the Port of London have been prepared for the consideration of Parliament. The first authorises the London County Council to purchase the docks at a cost of about 30,000,000*l.*, to dredge the river at a cost of about 2,500,000*l.*, and to increase the dues and charge any deficits upon the county rates; the second empowers the Thames Conservancy to raise 3,000,000*l.* to be expended in dredging the river, to strengthen the Thames Tunnel, and to make agreements with dock companies for enlarging the docks; and the third sanctions the construction of a barrage at Gravesend at a cost of 4,000,000*l.*

A COMMITTEE of the Privy Council has been appointed to consider the following points in connection with the establishment of a national museum and a national library in Wales:—(1) The place at which each of the two institutions should be established, having special regard to the amount of support which is offered both to the original foundation and to the future maintenance of the institutions by the local authorities and inhabitants of the several places which may be suggested. (2) The probable cost of erecting and of maintaining the institutions. (3) The contributions which may be expected from local sources either in land, money or buildings towards the above-mentioned cost. (4) The constitution of the trust or governing body which should be appointed to manage the institution, if established.

RURAL BY-LAWS.

ON Monday there was a discussion at the Surveyors' Institution of Mr. A. R. Stenning's paper on "Urban and Rural By-Laws and Suggested Amendments" and Mr. W. Menzies's on "Building By-Laws in Rural Districts."

Mr. W. Woodward said things had arrived at such a pass that soon a man might not be able to eat his dinner without

submitting the menu to the medical officer of health. Much mischief had arisen from the attempt to adapt the by-laws of London to the country. By-laws should be elastic. What was required was an Act of Parliament with general clauses as to width of road, lines of frontage, open space about buildings and water supply and sanitation.

Sir William Chance said he was in favour of reform. There had been undoubted evils, but in attempting to reform them the Local Government Board had rushed to the other extreme. There might be a code embodying the broad principles of building and sanitation. The best way to deal with the matter, however, was by Act of Parliament.

Mr. Casson said that for fifteen years he had been in charge of the By-Law Confirmation Department of the Local Government Board, and he agreed that by-laws should be in such a form as to be easily understood by the builders and those interested. They must be fair and uniform in their application, and above all they must be drawn with a view to the health and welfare of the occupiers of buildings. The model by-laws should be adapted to local needs. The rural district councils, notably that of Chailey in a recent case, had been attacked, but the Chailey Council only did its duty when it initiated against an esteemed gentleman proceedings which it would have been bound to take against a jerry-builder. The members were neither insincere nor overbearing; they simply upheld what was the law of the land, and he thought it would have been better if an example of compliance rather than of defiance had been set by the defendant.

Sir William Grantham thanked the great body of surveyors for the interest they had taken in his case, and for the trouble they were taking to obtain some modification of the existing by-laws and of the method in which they were carried out. He had been twitted with having drawn his own plans. Well, one did not take one's pleasures vicariously. He was often drawing plans, and the local builders, who could not draw them themselves, were always able to carry them out. When he was driven to build himself he went on in the way he was accustomed to, and he made a sketch which was sufficient for his own men, and notwithstanding the by-laws he hoped to continue. He thought the question of appeal from the Rural District Council's decision one of

great importance. He did not, however, believe there was need of a formal tribunal; let the appeal lie to the County Council, as it now did in other matters—say, in respect of roads, on which point he had himself successfully used the machinery against his own District Council. It was evident that Mr. Casson knew nothing of the facts, though he had appeared against him. He had declared it was a pity he (Sir William) had defied the Council. But the point was that the Council were breaking the by-laws, and tried to force on him the urban by-law, which he refused to accept not the rural by-law, with which he had complied, as the historical decision of the magistrates showed, for the finding was in his favour except on the question of ash-pits.

SHEFFIELD SOCIETY OF ARCHITECTS.

At the monthly meeting of the Sheffield Society of Architects and Surveyors, Mr. T. Swaffield Brown read a paper on "The Proper Relation of Design and Handicraft." The lecturer referred at the outset to the lectures and discussions of the Society on what are called practical subjects connected with art, and he wanted to call attention to ethical as well as practical considerations, these being generally neglected to the great detriment of art. He desired to do so because he thought it needed to be done, and that it was one of the few things which had better be done ill, and often, than not done at all. It was necessary, because in these matter-of-fact times such subjects are jostled out of the way, although they might illuminate much which puzzles the so-called practical man, who prefers to attribute to chance or accident much which is really due to spiritual insight—as in discussions on the origin of the Pointed arch and such matters. But there were signs that the efforts of great thinkers had stirred the still waters of apathy and brought to the surface one or two questions whose apparent complexity had diverted attention from their origin and hindered their solution. One of these was that of the proper relations of design and handicraft, about which much had been said and written by those whose trade it was to talk and write, but little by designers and craftsmen, whose

business it was to know and to do. The architect was the arch-type of designers, because the architecture of nations is the petrified symbol of the sum of their art, and of much else of importance in their history. And even now most design and work was in some way dependent upon architecture. Therefore it seemed a fitting opportunity to speak upon the relationship of design and handicraft. He thought these were not in a healthy condition, because of the common use of the two terms as things apart, not merely qualities of the same thing as inseparable for use as soul and body. And they were not only spoken of but treated as things to be practised by separate individuals, separate classes and in separate places. The effort of the last fifty years to popularise art practice had failed because it attempted to teach the unteachable. Art could not be taught. He gave some of the results of last year's examinations in support of the statement of failure. He suggested that the remedy was a system of co-ordinate education, which, beginning in the school, should lead the child through its different stages by selection at each step, eliminating early those whose dispositions were towards mechanical or commercial pursuits, and taking the others by wise advice and guidance along the paths which their experience and taste led them to choose, not putting them through the usual rigid course which so often leads to disgust and abandonment. He thought that this would restore the unity of art practice and elevate the worker, creating a force which would ultimately crush the sordid influences which made our surroundings what they were.

The customary vote of thanks was accorded to the lecturer.

EXHIBITION OF SCHOOL APPLIANCES.

Under the auspices of the Royal Sanitary Institute an interesting exhibition of school building and furnishing appliances was held from the 7th to the 10th inst., in connection with the Conference on School Hygiene, at the University of London, Imperial Institute Road, South Kensington.

The Acme Flooring and Paving Co., Ltd., of Gainsborough Road, Victoria Park, occupied a prominent position with a raised platform laid under the "Immovable Acme"

system of dowelled blocks in pitch pine, besides sample panels of the same system of flooring in various kinds of wood and a number of models showing the method of dowelling. Messrs. Bratt, Colbran & Co., of 10 Mortimer Street, W., made an attractive display of their "Heaped" Fire (Patent), the several advantages appertaining to which were manifest. Messrs. Doulton & Co., Ltd., of Lambeth, were well *en évidence* with their various sanitary specialties for schools, &c., including syphonic trough closets for children, improved closets for infants and children, isolated trough-closets, lavatories in ranges, baths for children, urinals, wall and pedestal fountains. Specimens were also shown of the anti-scalding mixing valve, so arranged as to give either cold, tepid or hot water.

The Berkefeld Filter Co., Ltd., of 121 Oxford Street, showed their well-known patent Berkefeld filter in a variety of patterns suitable for all purposes and adapted to meet all requirements. George Jennings, Ltd., of Lambeth Palace Road, had a good display of their improved sanitary appliances for schools, including lavatories, water-closets, urinals, and their patent warm fresh air ventilating grate made of terra-cotta. The Limmer Asphalte Paving Co., Ltd., of 2 Moorgate Street, E.C., were present with models representing mineral rock mastic roofing, stable and coach-house floors, damp-courses and vertical asphalte plates for damp walls.

An effective display of sanitary fittings and appliances for schools was made by Mr. T. A. Harris, of 56 Blackfriars Road, including the "Infantas," the "College" and the "Averta" pedestal closets, as well as the "seat-action" closet, which gives an efficient flush by means of a slight misplacement of the seat upon the user rising, and is specially adapted for use in schools, asylums, infirmaries, lodging-houses, &c. Well worthy of notice too was the "Ophthalmic" spray lavatory, with upward or downward spray as desired, which is intended principally for schools and institutions where ophthalmia prevails. Mr. T. A. Harris had in addition a good show of London-made brasswork, consisting principally of laboratory fittings. We may also mention that the Ellkay Patent Bath Syndicate, Ltd., of 59 Holborn Viaduct, had on view the "Ellkay" bath with fittings attached, which is designed to occupy a minimum of space.

Not the least attractive part of the exhibition, it may be added, were the several drawings and plans hung on the wall of schools and other buildings by various architects, including the drawings of new buildings for Christ's Hospital by Sir Aston Webb, R.A.

WATERPROOFING CONCRETE STRUCTURES.*

EVER since concrete has entered so largely into the field of construction as a substitute for stone masonry, there has been more or less discussion as to its permeability, and various expedients have been resorted to to prevent the seepage of water through the material. This refers more particularly to the large masses of concrete built for engineering structures. I am aware that there has been more or less success in making concrete impervious to the action of water by various means, but do not think that any of them have given such satisfaction as to become generally used.

It is a question whether the addition of alum, soap and other extraneous material does not affect the lasting qualities of the concrete. If the announcement of the Star-Stettin Portland Cement Works that they are now manufacturing, according to a process invented in Germany, a waterproof cement which will become impervious to water, will resist the action of frost, heat, hot water, sea water and diluted acids, is borne out, the question of waterproofing concrete is settled for all time. However, concrete, as usually built in many engineering structures, is not impermeable to the action of water, and some method of waterproofing the same, I think, is vitally necessary. That this is appreciated by engineers is clearly evidenced by the amount of waterproofing that is now being done on concrete arches, abutments, retaining walls, &c. I have recommended for years the necessity of waterproofing both stone masonry and concrete structures where there was any danger of seepage of water, and believe that such a precaution will extend the life of the structure.

A recent examination of concrete abutments, retaining walls, &c., built in Chicago some years ago, disclosed the

COOKING. LAUNDRY, HEATING. VENTILATION, Etc.

fact that water was seeping through the mass in several places, particularly along the parting planes where the work was not carried on continuously. This condition is frequently observed in concrete construction, and I think could be entirely prevented if the back of the structure was thoroughly waterproofed with asphalt.

Some years ago I had occasion to repair some masonry arches built in 1862 that were rapidly disintegrating owing to the infiltration of water. These arches were uncovered, the damaged stone replaced, and the extrados of the arch was plastered with cement concrete and then thoroughly waterproofed with asphalt. Time has demonstrated that this work was very successful. I have since uncovered a number of arches that were leaking, and found that the concrete backing did not prevent the entrance of water. These were cleaned off and waterproofed with asphalt in each case. It is now the practice on a number of railroads to thoroughly waterproof all arches, abutments, retaining walls, &c. The method generally employed is to use as a first coat asphalt cut with naphtha, to be applied as a paint to the concrete after the same is perfectly dry, and then cover the surface with an asphaltic mastic composed of one part of asphalt to four of sand; this to be smoothed off with hot smoothing irons and thoroughly tamped and pressed into place. If the filling over the arch is ordinary gravel or dirt no other work will be necessary, but if it is filled with broken stone or stone chips it is better to cover the surface of the asphalt with washed roofing gravel so that the broken stone will not cut or damage the asphalt surface.

There are various other methods employed in waterproofing concrete surfaces with asphalt, such as the use of burlap or other fabric embedded in the asphalt coating. It is very difficult to make hot asphalt adhere to a concrete surface, however dry the same may be, unless it is heated by artificial means. Hot asphalt laid on ordinary dry concrete will not adhere, and can be rolled up like a blanket after it has cooled. I have had some success in applying hot asphalt direct to concrete surfaces after the same had been dried and heated with hot sand, but much prefer the use of the asphalt cut with naphtha applied as painting or swabbing coat. The cost of this work with present prices of first-class asphalt will range from 10 to

20 cents per square foot, depending upon local conditions. It does not require any special expert knowledge for its application. After a brief coaching the forces as usually employed can produce a satisfactory job.

It might be well at this time to say something about the quality of the asphalt to be used for waterproofing purposes. In the past few years there has been a large development of asphalt for this purpose, and it is now possible to get, at a reasonable price, a pure asphalt that will not flow under a temperature of 212 degs. and not become brittle, when spread thin on glass, at 15 degs. below zero. Also it will resist the action of acids and alkalis.

The following specification is one that I have used with good results in waterproofing works:—

"Asphalt shall be used which is of the best grade, free from coal tar or any of its products, and which will not volatilise more than one-half of 1 per cent. under a temperature of 300 degs. Fahr. for ten hours. It must not be affected by a 20 per cent. solution of ammonia, a 35 per cent. solution of hydrochloric acid, a 25 per cent. solution of sulphuric acid, nor by a saturated solution of sodium chloride.

"For metallic structures exposed to the direct rays of the sun the asphalt should not flow under 212 degs. Fahr., and should not become brittle at 15 degs. Fahr. when spread thin on glass. For structures underground, such as masonry arches, abutments, retaining-walls, foundation-walls of buildings, subways, &c., a flow point of 185 degs. Fahr. and a brittle point of 0 deg. Fahr. will be required. The asphalt covering must not perceptibly indent when at a temperature of 130 degs. Fahr. under a load at the rate of 15 lbs. per square inch, and it must remain ductile at a temperature of 15 degs. Fahr. on metal structures and at 0 degs. Fahr. on masonry structures under ground.

"Before applying asphalt to a metal surface it is imperative that the metal be cleaned of all rust, loose scale and dirt, and if previously coated with oil this must be burned off with benzine or by other suitable means. The metal surface must be warm to cause the asphalt to stick to it, and the warming is best accomplished by covering it with heated sand, which should be swept back as the hot asphalt is applied. When waterproofing masonry struc-

tures, if the surface cannot be made dry and warm it should be first coated with an asphaltic paint made of asphalt reduced with naphtha. This is particularly necessary for vertical surfaces.

"The asphalt should be heated in a suitable kettle to a temperature not exceeding 450 degs. Fahr. If this is exceeded it may result in 'pitching' the asphalt. Before the 'pitching' point is reached the vapour from the kettle is of a bluish tinge, which changes to a yellowish tinge after the danger point is passed. If this occurs the material should be tempered by the addition of fresh asphalt. The asphalt has been cooked sufficiently when a piece of wood can be put in and withdrawn without the asphalt clinging to it.

"The first coat should consist of a thin layer poured from buckets on the prepared surface and thoroughly mopped over. The second coat should consist of a mixture of clean sand or screenings, free from earthy admixtures, previously heated and dried, and asphalt, in the proportion of 1 of asphalt to 3 or 4 of sand or screenings by volume; this is to be thoroughly mixed in the kettle and then spread out on the surface with warm smoothing irons, such as are used in laying asphaltic streets. The finishing coat should consist of pure hot asphalt spread thinly and evenly over the entire surface, and then sprinkled with washed roofing gravel, torpedo sand or stone screenings, to harden the top. The thickness of the coating will depend on the character of the work and may vary from $\frac{3}{4}$ to 2 inches in thickness.

"Where a quantity of asphaltic concrete is required, such as in trough floors on bridges, a concrete should be made in the proportion of one part asphalt, two parts sand and three parts limestone screenings, thoroughly mixed and rammed into place with tamping irons on the first coat of pure asphalt with which the metal was originally covered. At all drainage holes large sized stone should be carefully placed to insure perfect drainage."

It may not be out of place in discussing the question of waterproofing to call attention to the necessity for provisions for drainage in all concrete and masonry structures. This has not been given as much attention as it should receive. Whether waterproofing material is applied or not,

the question of thoroughly draining the structure is of the greatest importance.

In ordinary building construction sufficient attention has not been given by architects and builders to the proper waterproofing of their foundation walls. I have observed recently in this vicinity a number of buildings in process of construction where the excavations for the cellar and lower foundations were made in a clayey material and concrete foundation walls put in without making any attempt to apply a waterproofing or damp-proof coating to the wall, or provide suitable drainage to carry off the ground water.

In this particular we are falling away behind even the early Roman architects and builders. In all the examples of their work it is evident they gave the greatest consideration in their construction to proper methods for keeping their foundation walls dry, and we cannot do better to-day in such matters than follow the advice of the great architect, Vitruvius, who, writing about twenty-five years B.C., described methods of waterproofing and ventilating foundation walls that compare favourably with the best methods used to-day, excepting that we may have better materials for waterproofing than were known at that time.

Asphalt, I believe, makes the best damp-proof or waterproofing material that can be used in foundation walls and for all structures where such provision is necessary. It has been used from the earliest times for the purpose of protecting material from air and water, and we have examples of it in our museums where the mummy cases were sealed with this material more than 3,000 years ago.

AN INDUSTRIAL NAPLES.

In his last report Mr. Consul-General Neville-Rolfe gives the following account of a project by which Naples will be supplemented by a quarter which will be devoted to manufactures under conditions unlike those elsewhere:—

An Act of Parliament, which it is hoped may open up an industrial future for Naples, received the Royal sanction on July 8, 1904. Its scope is purely commercial, and is framed with a view to create an industrial centre where none exists, or in fact ever has existed; to give work to a

population ever redundant and always in the depth of poverty, but by no means devoid of cleverness, of strong imitative instincts, and above all, extremely intelligent in manual work and teachable in arts and crafts.

When Joseph Bonaparte was king of Naples in 1806 he founded an institution for the encouragement of Naples, having precisely the same aims as the law which has just been passed. King Joseph's institution is still existing, and it is by utilising this existing machinery that it is proposed to give effect to the new legislation. The institution itself is not sufficiently strong to do much on its own account, but it has come out as a strenuous supporter of the new departure, though its spokesman admits that a special Act for the benefit of a single city is a very exceptional incident, and that its provisions are consequently in themselves exceptional also. The object of the Government was to gain a certain simple and definite end, namely, the establishment of an industrial centre in Naples, and in order to do this it became necessary to settle material conditions in such a way as to induce capitalists both from the North of Italy and from abroad, perhaps especially the former, to employ capital at Naples. The text of the law gives all the details with great clearness and precision. It is the result of the labours of a Royal Commission, which has been at work since 1901, and was appointed to "formulate propositions adapted to improve the industrial conditions of Naples."

In order to come to a correct understanding of the case it will be necessary to say a few words on the existing conditions of the problem. In the sixteenth century Naples was the second city of Europe in size and population. Now it is not only the most populous city in Italy, but it is the centre of attraction of all the southern provinces. The nearest port north of it, worthy of the name, is Leghorn, which is some 200 miles from it; to the south, Messina, about 150 miles off, and naturally the conveyance of the inland traffic of the southern provinces is all to Naples. The southern ports of the Adriatic attract goods only in their immediate neighbourhoods. They are small, inconvenient and, for business purposes, on the wrong side of the peninsula. Bari is the only one of them that has any commercial importance.

The population of Naples and suburbs amounts to 800,000 souls; her university, one of the most ancient in

Europe, numbers 6,000 students. The wealthy classes from all the southern provinces live at Naples for a great part of the year, and hence there is no doubt that it is the principal consumer among all the cities of Italy, and should logically take its place as the chief producer. Naples, moreover, has for several centuries, under the old *régime*, been the capital of by far the largest State in the peninsula. All this goes to prove the necessity of the steps which the Government of Italy has taken to make of her an industrial city.

Political men of all the numerous Italian parties have explicitly declared their conviction that from the national point of view it is necessary to transform Naples into a vast industrial centre.

Naples possesses cheap labour, an intelligent population and, above all, a most sober lower class. The surrounding country is of the most fertile description, enabling the industrious working-man to live at the cheapest imaginable rate. Rents are low for the accommodation required by the working-man. Fuel is practically unnecessary, and cotton blankets and quilts are sufficient night covering. There is hardly a day in the year when 10 minutes brisk walk will not warm anyone for the rest of the day, for on the few cold days of the year there is always a bright sun. The dull days are warm, and during winter there is always a southerly wind. The drinking water, the best furnished to any city in the world, is most abundant; the numerous standpipes in the city provide it gratuitously in a continuous flow to the whole population. The death-rate of Naples is lower than that of any city of Italy, and shows steady and continuous diminution; it is, in fact, lower than the average of European cities of its size.

Given these facts, we may now turn to the natural advantages of the site for the inauguration of an enterprise which hopes to attract foreign capital.

To the eastward of Naples lies a vast plain, which is kept in a high state of cultivation, though it is not largely inhabited, having upon it only the cottages of the peasants who cultivate it. It is carefully irrigated, and this gives it the appearance of a marsh, which it scarcely deserves. It is, however, unsuitable for residential purposes, partly from its vicinity to the squalor of the extreme east end of the town, and partly on account of the noisome and noisy trades already established there. For the purpose of erect-

ESTABLISHED OVER 200 YEARS.

ing a series of factories there could be no better place. It is intersected by railways, and is in convenient reach of Naples harbour. The large working-class town of Barra is situated on the edge of it, and not more than a couple of miles from any part of it. The land between the plain and the sea is all taken up by factories and shipbuilding yards, and Vesuvius is far enough off not to be a cause of danger.

It is here that the Government propose to create a free zone to attract manufacturing capitalists.

The advantages offered are manifold. First of all they are to have the freehold of the soil at an extremely reasonable, almost nominal, price; secondly, factories established within ten years of the passing of the law are to enjoy for ten years from the date of their establishment complete immunity from direct taxation. They are to be free of income tax (and income tax is at the rate of 20 per cent. in Italy on ordinary incomes and of 10½ per cent. on trade profits), nor will they pay taxes on their buildings and lands taken up for the purposes of their undertakings. They are also to be free from all customs due on plant or machinery, tools and fittings of all kinds imported from abroad, building materials, &c. They are also to be allowed to have salt at cost price, instead of at the monopoly price charged by the State. This in the case of chemical works is a very important concession, the monopoly price of salt in Italy being well-nigh prohibitive, while the mineral itself is extraordinarily plentiful.

One-eighth of the rolling-stock of the Italian railways is to be made at Naples, and the contracts will be divided between the old firms and the new ones. Lastly, the Government undertakes to furnish motive power at the cheapest rate, and in order to do this electric force is to be brought from the source of the river Volturno, which is to be developed to 16,000 hydraulic horse-power, which, when converted into electric energy, will be brought into Naples for the benefit of the industries. It is calculated that the introduction of electricity will be accomplished on wonderfully easy conditions. The capital will be furnished by the State at 3½ per cent., and the energy furnished is calculated to be paid for during the dark hours by the adoption of the light in the villages through which it will pass; and the line will pass through a district populated at the rate of 1,287 inhabitants per square kilom. (3,333 per square mile),

leaving the energy to be sold in the daytime for industrial purposes at the rate of something less than 100 lire (4s.) per annual horse-power for the twelve daylight hours. Taking the average use of the power for business purposes at nine hours a day, the rate anticipated will perhaps be as cheap as any motive power existing anywhere.

As to the particular class of industries likely to be successful in the conditions set forth, it is perhaps a little difficult as well as being somewhat invidious to speak. To sum up the matter, the following advantages are offered to all industries alike:—

(1) A vast inland market; (2) easy conditions of import and export; (3) exemption from taxation which is practically complete; (4) abundance of good labour; (5) salubrity of climate and excellent water; (6) motive power at a cheap rate; (7) abundance of raw material; (8) the easiest conditions possible for exportation to America (North and South) and to Africa and the Far East.

The enormous emigration from the southern provinces causes a movement of shipping to and fro, with exceptionally low freights.

Chemical works producing sulphate of copper, artificial manures, sulphuric and other acids should have a large opening. All industries relating to tinned vegetables, fruits, compressed hay and preserved agricultural products generally should succeed.

Hemp and flax, now exported in the raw state, might be manufactured at a satisfactory profit. In short, all industries requiring labour and motive power should find a profitable home under this exceptional scheme.

The reverse of the medal is the condition of the existing industries. It is obvious that competitors coming in with the newest machinery, and the protective advantages so lavishly offered them, will cause a very serious competition to firms established already whose machinery is out of date, and whose output cannot compare with that of up-to-date concerns. The answer given to that is, that there is no firm at Naples, excluding those which are practically kept going by Government orders, which employs 500 hands, and this is why the new law, while promoting the establishment of a new industrial epoch for the southern provinces of Italy, is in no way likely to disturb the existing balance of trade and commerce.

EDITORIAL NOTICES.

of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

IMPORTANT NOTICE

TO THE

ARCHITECTS & CIVIL ENGINEERS OF WESTMINSTER.

Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

3 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be obtained at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

COMPETITIONS OPEN.

AYLESBURY.—Feb. 28.—For public elementary school for 750 children. Premiums 50*l.* and 25*l.* Conditions and plan of site obtainable from Mr. C. G. Watkins, Education Secretary, Aylesbury, on payment of 1*l.* 1*s.*

LAMBETH.—March 30.—For municipal buildings at Brixton Hill. Particulars from Mr. H. J. Smith, Town Hall, Kennington, S.E.

NELSON.—March 4.—Designs for a free public library. Premiums of 50*l.*, 25*l.* and 15*l.* Mr. J. H. Baldwick, town clerk, Town Hall, Nelson.

PRESTON.—Feb. 28.—Designs and plans for new elementary school. Premiums of £50, £30 and £20. Plan and conditions from Director of Education, Education Offices, Preston.

WOLVERTON.—Feb. 28.—For public elementary school for 400 girls and 400 infants. Premiums 50*l.* and 25*l.* Also for secondary school to accommodate about 120 boys and girls. No premiums offered. Conditions to be obtained on payment of 1*l.* 1*s.* in each case from Mr. C. G. Watkins, Education Office, Aylesbury.

CONTRACTS OPEN.

AINSWORTH.—Feb. 27.—For the erection of new hospital at Ainsworth, for the Bury and District Joint Hospital Board. Mr. Henry Lord, architect, 42 Deansgate, Manchester.

ANNAN.—Feb. 25.—For extensions to cotton mill, Port Street, Annan. Messrs. Johnstone Bros., architects and surveyors, 39 Lowther Street, Carlisle.

ASHTON-UNDER-LYNE.—Feb. 28.—For excavating and draining, &c., to nurses' home at Hartshead. Mr. Joseph Lowe, surveyor, Town Hall Chambers.

ASHTON-UNDER-LYNE.—March 6.—For the erection of vicarage for St. James's Church, Ashton-under-Lyne (stone building). Messrs. Thos. George & Son, architects, 7 Warington Street.

BARMING HEATH.—March 14.—For infectious hospital, day-room, bays to additional buildings, alterations and additions to laundry and other works at the Barming Heath asylum, near Maidstone. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

BATLEY.—Feb. 28.—For the erection of a new post office at Batley, Yorks. Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W.

BIRDWELL.—Feb. 25.—For the whole or any portion of the works required in erection of two houses. Mr. A. Whitaker, architect, Worsbrough Bridge, Barnsley.

BIRSTALL.—March 10.—For the erection of a small-pox hospital at Birstall, for the Oakwell Joint Hospital Board. Mr. Wm. Middlebrook, clerk, 70 Huddersfield Road, Birstall, near Leeds.

BROMLEY.—March 7.—For the erection of a public library in the High Street, Bromley, Kent. Mr. Evelyn Hellicar, architect, 10 Serjeants' Inn, E.C.

BURY.—Feb. 27.—For the erection of cottage for the Bury and District Joint Hospital Board, Lancs. Mr. Fred Wild, clerk, Cross Street, Bury.

CARDIFF.—For building two workshops at Garth Colliery and excavating foundations for coke ovens. Elders Navigation Collieries, Ltd., Merchants' Exchange, Cardiff.

CARDIFF.—For a railway waggon repairing shed, to be constructed of iron, for the Windsor Steam Coal Company, Ltd., 3 Bute Crescent, Cardiff.

CASTLE DONINGTON.—For Wesleyan church at Castle Donington, Derby, with vestries and lecture hall. Mr. A. E. Lambert, architect, 22 Park Row, Nottingham.

CHEDDLETON.—March 4.—For the erection of infants' school, Cheddleton. Mr. Graham Balfour, director of education, Education Committee, Stafford.

CLIFFE-CUM-LUND.—Feb. 25.—For additions and alterations to the Cliffe-cum-Lund schools, near Selby. Mr. T. S. Ullathorne, architect, Selby.

COBHAM.—March 22.—For the erection of a laundry (fitted with certain appliances for hand-power only) at the isolation hospital, Whitehill Road, Cobham, near Gravesend. Mr. Archibald E. Loach, 8 Northcote Road, Strood.

COCKERMOUTH.—Feb. 25.—For the erection of an entrance lodge at St. Helens, Cockermouth. Estate Office, Cockermouth Castle.

CONNOR DOWNS.—March 3.—For the erection of ten houses and boundary walls at Connor Downs, Cornwall. Mr. Sampson Hill, architect, Green Lane, Redruth.

COUNDON.—March 4.—For the erection of a Roman Catholic elementary school at Coundon, Bishop Auckland. Mr. J. Keenan, architect and surveyor, North Bondgate, Bishop Auckland.

CRIGGLESTONE.—Feb. 28.—For the erection of new classrooms, &c., at the Crigglestone British Provided schools, near Wakefield. Mr. J. Vickers Edwards, county architect, County Hall, Wakefield.

DRAYTON BASSETT.—March 4.—For new school, Drayton Bassett, for the Staffordshire County Council. Mr. Graham Balfour, director of education, Stafford.

DRINGHOUSES AND KINSLEY.—Feb. 28.—For pulling-down temporary school at Dringhouses, near York, and removing and re-erecting on a site at Kinsley, Hemsworth; also for certain alterations in connection therewith. Mr. J. Vickers Edwards, West Riding architect, County Hall, Wakefield.

DRINGHOUSES.—Feb. 28.—For the erection of covered sheds at Dringhouses Without Provided school, near York. Mr. J. Vickers Edwards, West Riding architect, County Hall, Wakefield.

DUBLIN.—Feb. 28.—For the supply and erection of temporary buildings to cover about 9,000 square feet, for use as engineering lecture-rooms and workshops, for the Department of Agriculture and Technical Instruction for Ireland. The Department, 4 Upper Merrion Street.

EASTBOURNE.—Feb. 25.—For additions to the motor omnibus house at Roselands. The Borough Surveyor's office, Town Hall.

ELLAND.—Feb. 28.—For the erection of a new closet and lavatory, &c., at the old Town Hall, Elland, Yorks, for the County Council. Mr. J. Vickers Edwards, West Riding architect, County Hall, Wakefield.

RAWTENSTALL.

For the erection and completion of a market hall and lock-up shops on the market ground, Newchurch Road, Rawtenstall, Lancs, for the Corporation. Mr. J. JOHNSON, borough surveyor.
J. TINLINE, Bury (accepted).

TRADE NOTES.

MR. THOS. BROWETT, M.I.M.E., M.I.E.E., has been appointed manager of the Diesel Engine Co., Ltd., 179 Queen Victoria Street, E.C.

THE London office of Mr. William E. Farrer, the sanitary specialist of the Star Works, Birmingham and Cardiff, has been removed from 52 Queen Victoria Street, London, E.C., to 39 Victoria Street, Westminster.

A LARGE clock has just been erected in the tower of the parish church, West Melton, Yorkshire, which shows time on two illuminated dials and strikes hours. It is fitted with all the latest improvements and is generally to the designs of Lord Grimthorpe. Messrs. John Smith & Sons, Midland Clock Works, Derby, have carried out the work.

MESSRS. OETZMANN & Co., 67-79 Hampstead Road, have introduced an ingenious novelty in their "Chameleon" suites of bedroom furniture, which, without departure from artistic lines and without any complicated folding, twisting about, or mechanical movements, or personal effort, can be converted into a suite of a different class, transforming the bedroom during the day into a modern boudoir for a lady or a sitting or smoking-room for a gentleman.

THE advent of an appliance which can lessen the cost of work must be always welcome, and in this class the new pipe-fitter's screwing machine, just brought out by Messrs. Charles Winn & Co., Birmingham, should be included. The features distinguishing it from the same class of machines hitherto procurable are lightness and cheapness, although neither quality has been gained at the expense of strength or durability. The only accessories requisite are a single spanner and a tommy lever for adjusting the dies.

THE MOMENTUM ENGINE (Patented). The Discovery of Mechanically-made Power. NOW IN OPERATION AT THE ALEXANDRA PALACE, LONDON, N.

THE discovery; that, a free racing Flywheel possesses two natures, under one—it will receive rotary motion for the application of twenty pounds—notwithstanding it weighs a ton, and the second nature of the Flywheel is, that when it is connected to a working load it will throw out the rotary value of the centres of the weights in motion, by the square of the velocity, the centre of Gyration. This discovery means several great Flywheels, each separately driven by any motive power, each Flywheel taking its regular turn to revolve working shaft, to which it is connected, and from which it is disconnected for a greater length of time. Radium, and also these Engines, prove that the Theory of Energy is false. This Engine can be seen running the electric light at the Alexandra Palace. It is explained free. The Engine has taken a first-class Diploma of Merit at the Alexandra Palace for Electric Lighting.

VARIETIES.

MR. J. HOWARD COLLS was the recipient of a presentation at the annual dinner of the London Master Builders' Association at the Trocadéro Restaurant on Wednesday last.

MESSRS. A. & J. MAIN & CO., LTD., Clydesdale Iron Works, Possilpark, Glasgow, and London, have secured from the Egyptian Railway Administration the extensive contract for steel palisading in open competition.

LEEDS has received an order for 500 steel waggons of considerable capacity for the South American Railway Company, and this will give some stimulus to trade in the locality.

QUARRYING of granite at Eskdale, Cumberland, has been commenced, and a company has been formed to reopen the quarries at Waberthwaite. It is proposed to lay down a line to connect the quarries with the Furness Railway at Eskmeals.

THE Southport Corporation gas committee have approved of plans for the extension of the retort-house, and for the construction of forty retorts and regenerative furnaces capable of making 500,000 cubic feet of gas a day. The cost will be about 7,000/.

THE Scottish banks have formally intimated to the Edinburgh Town Council that in future their rate for short loans will be at the minimum of 4 per cent. and a maximum of 1 per cent. above the Bank of England rates. The Edinburgh Corporation, when they have money to borrow, give the banks each a turn.

A DREDGER is now at work in the German military port of Wilhelmshaven, which is claimed to be the largest in the world. It is about 245 feet long, and at its trial dredged 5,150 cubic yards of sea bottom material in an hour. It daily moves from the harbour and empties into the open sea 27,720 cubic yards of detritus. The port was found to be accumulating sand at a rate with which ordinary dredgers could not cope, and a special vessel had to be built.

THE Medical Faculty of the Catholic University Medical School, Dublin, have passed the following resolution:—"That this Faculty is of opinion that the establishment of a public health museum by the Department of Agriculture and Technical Instruction of Ireland would be of great

educational advantage to the public and many professions and trades."

SIR WILLIAM WILLCOCKS, who has returned to Cairo from Mesopotamia, believes, according to the *Morning Post*, that the Tigris and Euphrates have water enough to allow of the irrigation of 5,000,000 acres and navigation to the sea. The hydraulic problems involved are easier than those connected with the Nile, but measures against silting will be necessary. The first work needed is an irrigation and navigation canal joining the two rivers at Bagdad. He estimates the water entering Babylonia at 50,000 cubic feet per second by the Tigris, and 25,000 by the Euphrates. He has returned with a hundred samples of soils and building materials, and after they have been analysed he will be able to frame estimates.

THE Italian Government have guaranteed a first instalment of 600,000/ sterling to be expended in the construction of a new harbour at Genoa, the plans of which have been definitely approved. The new coal basin will be an extension of the breakwater in a north-westerly direction for a distance of about 1,500 yards; the Passo-Nuovo on the western side will be widened to double its present space, so forming a huge basin giving a water space of 96 acres, with extensive new quays and a minimum depth of 12 metres. These quays will be amply provided with railway lines capable of receiving about three times the number of railway trucks it is now possible to accommodate in the part of the port assigned to the coal trade.

THE preamble of the Bill to incorporate the Channel Ferry Railway and Quay Co. describes the proposed works as intended "for the purpose of enabling trains to be embarked upon and landed from specially constructed vessels in connection with the trans-Channel traffic between Dover and the Continent." The works are to comprise three short lengths of railway connecting with the South-Eastern and Chatham Railways at one end, and terminating "at a point in the sea" 263 yards from the southern extremity of the South Pier at the entrance to Dover tidal harbour. From the extremity of the South Pier the railway will be constructed on a pier or breakwater terminating with a movable quay or landing stage. The capital proposed is 270,000/ in shares and 90,000/ in debenture stock for

equipment purposes. The time allowed for the completion of the works is five years from the passing of the Act.

THE throne for the Bishop of Birmingham and archdeacon's and canons' stalls have now been erected in the pro-cathedral of St. Philip's in readiness for the enthronement service on March 2. They are of the later Renaissance period of architecture. The throne and chaplain's seats stand in the first bay of the chancel nearest to the nave. The archdeacon's and canons' seats occupy the eastern bays at the back of the existing choir stalls. The throne is approached by steps and, with the canopy, rises to a height of over 12 feet. On the front of the canopy is a carved pediment with the Bishop's mitre carved in high relief. In front of the throne is an elaborately carved desk with moulded and carved panels of Classic design.

THE committee of the Italian Chamber of Commerce, London, have made the following announcement:—"On behalf of the Italian Minister of Public Works we beg to inform you that a very important tender will be held on May 3, in the offices of the Public Works Department in Rome, for the grant of the construction and carrying on of the Apuleian aqueduct, whose waters are to be drawn from the Sele sources at Caposele (province of Avellino). The grant will last ninety years, to begin from the date of the order confirming the final approbation of the work. The Government will contribute to the cost of the aqueduct the sum of about 5,000,000*l.* Both Italian and foreign firms will be allowed to take part in the competition."

A TWO-STORY brick building, sixty years old and weighing over 200 tons, was removed from its site in a suburb of Pittsburgh, U.S.A., to a distance of four miles by water. The difficulties encountered were many. The ground lying between the house and the river was of such a soft, marshy nature that the building was constantly in danger of collapsing. When the house was placed upon the shore of the river a flood rose, surrounding the building to a depth half-way to the second storey. In order to prevent it from being washed away the blocking and rollers had to be weighed down with beams and steel rails. The house was afterwards lowered upon a large coal barge. This being done it was gradually towed down the Allegheny river, but owing to the four low bridges between it and its

destination the barge had to be scuttled before passing each bridge, the water being pumped out afterward. It had also to be lowered through a lock, and finally three tracks of the Buffalo, Rochester and Pittsburg Railroad had to be crossed within 30 minutes.

ELECTRIC NOTES.

THE Wilmslow Council have decided to adopt electricity for street lighting.

AN electrical exhibition organised by the Bexhill Corporation was opened on the 17th inst. at the Kursaal. It has for object the popularising of the uses of electricity. It will close on the 25th inst.

DURING the past year the total receipts from the electricity undertaking of the Huddersfield Corporation amounted to 26,723*l.* and the expenditure to 13,313*l.*, leaving a surplus balance of 13,410*l.*, from which, however, the following deductions had to be made:—4,715*l.* for interest on loans, 3,492*l.* contribution towards redemption of debt, and 1,327*l.* the amount repaid to the public works board, leaving a balance of 3,875*l.* That amount, along with 2,110*l.* from the depreciation and contingencies account, will be used in relief of the rates by way of refunding money received from the borough rate towards previous deficiencies on revenue account.

THE Secretary of State for the Home Department has stated in answer to an inquiry whether the rules respecting the use of electricity in and about coal mines have now been settled and published, and in that case in what Parliamentary paper can a copy be found, that they have been settled with the Owners' Association and approved by the men's representatives. They are not yet in force, as they have to be proposed by statute to each collieryowner individually; but the notices of the proposal, some thousands in number, will all have been despatched within the next few days, and the rules will in each case come into force if not objected to within twenty days from the receipt of the notice. The rules as settled have not yet been made public.

NEW CATALOGUE.

THE Armorduct Manufacturing Company, Ltd., have issued a catalogue which has the advantage of also serving as a diary and memorandum book, that can be carried in the pocket. The special conduit system was introduced by the late Mr. Fred. Bathurst. The tubes are of steel, lined with a peculiar enamel, which preserves the metal from rust and oxidation. The first part relates mainly to conduits. There is also an "accessories section," which by illustrations exemplifies all the auxiliaries in the form of fittings for efficient lighting. The bell and telephone section is also complete. Prices are given in all cases. The catalogue will suggest the extent of the business of the Armorduct Company and their readiness to meet promptly all demands of architects, engineers and the public in general.

CEMENT TESTING.

"SALTER" and "springs" are so closely associated in the minds of many classes of business men it is difficult to think of one without recalling the other. From the simple door-spring which can be bought for about a shilling and which is to be found in every room of many large offices in London, to various automatic machines on a large scale, Messrs. G. Salter & Co. have demonstrated the power which is derived from elasticity of metals. Among their late inventions is a cement testing machine, which will be invaluable to borough surveyors, civil engineers, architects, contractors, and to all who are responsible for the efficiency of cement. The briquette is held between two clamps of horseshoe form, which are connected with a pair of compound levers with steel knife edges and carried by a janned column, the whole forming a sensitive balance. From one arm of the upper lever a bucket is hung which can be filled slowly with shot from a reservoir. The effect of the weight is to raise the upper clamp, and under the strain the briquette breaks. The supply is cut off and the bucket of shot descends at the same instant. The weight can be ascertained on the Salter's balance which is part of the apparatus. Loads up to 1,000 lbs. can be applied, which

is much in excess of the usual requirements. The machine is strongly made, and its efficiency and exactitude have been repeatedly proved by daily use.

THE PULSOMETER AND WATER-SUPPLY.

A "MAMMOTH" patent air-lift pump has been fixed by the Pulsometer Engineering Company, Ltd., in order to supply the Midland Hotel, Reading, with water at the rate of 5,000 gallons per hour, and according to specification the steam used per hour was not to exceed 6,000 lbs. weight. When the actual test was made 7,000 gallons per hour were raised under the specified conditions, or 100 lbs. of water delivered for every 1 lb. of steam used, which works out at considerably less than 1d. per 1,000 gallons for fuel. The water is raised from a borehole some 500 feet deep and delivered into a tank on top of the hotel 160 feet above the water-level. Owing to the borehole being under some shops adjacent to the hotel, it was found necessary to divert the rising main by many turns and bends before a straight lead could be found for it to the top tank. The water is raised in one lift, and this is perhaps the first time on record—in England at any rate—where so big a task has been attempted and has come through with such economical results, results entirely due to the use of Borsig's patent "mammoth" pump, which after most successful application on the continent has now been introduced into this country by the Pulsometer Engineering Company.

PORTLAND CEMENT.

It was a happy thought on the part of the Nottingham Master Builders' Association to obtain the services of Mr. G. M. R. Layton, B.A., managing director of the Associated Portland Cement Manufacturers (1900), Ltd., for the delivery of a lecture on the material which is produced under his direction. As it was open to all in Nottingham who are connected with architecture, engineering and building, there was an attendance on last Friday evening in University College which by its numbers surprised those

who were accustomed to the limited audiences which are usually to be seen at lectures on scientific subjects. It is well that workmen should be made acquainted with the processes of manufacture of cement, of which the employment is continually increasing, for in that way they will be able to take more interest in the constructive operations into which it enters and which they help to carry out. Mr. Layton's explanations were suited to all capacities, and had moreover the great advantage of being inspired by experience, for workmen quickly detect whether a lecturer is speaking from information derived from books or from practical knowledge. If there was any difficulty in realising Mr. Layton's descriptions it was removed by admirable collections of vivid photographs which brought all the operations as it were under the eyes of the audience, and they became spectators as well as listeners.

Mr. Layton claimed for Portland cement the right to be considered as a British invention. The credit for it was given to Aspdin, a bricklayer, but the process he employed differed greatly from that now adopted. In his days it was not easy to obtain a knowledge of chemistry, and there could not fail to be empiricism about the early processes. As a result there was uncertainty about the qualities. When the material was taken up by engineers for use in positions where failure would be disastrous, it was necessary that there should be definite strength, and to meet their requirements more scientific methods of production were employed. A system of testing was devised, and is still applied with a rigour beyond that for other materials used in construction. Besides strength it became necessary to have standards of fineness, and manufacturers can now realise the conditions of architects and engineers in both respects. Recently a standard fineness and standard strength have been recommended by the Engineering Commission, and there can be no doubt both will be attained and kept up. The lecturer described at length the processes adopted for manufacture in this country and America, especially in the great works of the Associated Portland Cement Manufacturers on the Thames, Medway, and elsewhere. Chalk and clay are mixed in definite quantities in a pit partly filled with water by means of special apparatus. The mixture, or "slurry," after undergoing preliminary mixing and grinding, is made to pass into secondary mills, where the semi-fluid

mass is thrown against fine screens, out of which it cannot pass until very finely incorporated. The part which passes through the screens, after other operations, is received in special mixing tanks where, by means of beaters, the mixture at last acquires thorough uniformity. The slurry is burnt to clinker at a temperature of 2,700 degs. Fahrenheit during its passage through rotary kilns. Then a cooling process has to be gone through before the final grinding which leaves the cement ready for use. It is impossible without diagrams to do justice to the lecturer's explanations, but there was a general feeling of surprise that a material which appears so simple requires such a long series of operations before it is a marketable product.

From the lecturer's descriptions it would appear as if there was a due reward for the trouble. The purposes for which Portland cement can be applied are becoming more numerous. The so-called "reinforced concrete" would not be an actuality without it, and as much may be said of many important engineering works. The Associated Portland Cement Manufacturers (1900), Ltd., have a large share in the enormous supply which has become necessary, for about 4,000 tons per day can be turned out from their various works. The lecturer was listened to throughout with interest, and at the close was deservedly applauded.

PRACTICAL SANITARY SCIENCE.

THE following examination questions were proposed at the recent examinations of the Royal Sanitary Institute:—

Newcastle, November 4 and 5, 1904.

1. State Graham's law of the diffusion of gases. Give some illustrations of the operation of this law in the natural ventilation of dwellings.

2. What are convection currents in a liquid, and how are they caused? Is there any corresponding motion in gases; if so, how is it generated, and what is its effect on the atmosphere?

3. State fully the necessary conditions for obtaining a healthy site for a school or college, in relation to—(a) Water

Telephone No. 773 King's Cross. Telegraphic Address, "Veneer, London."

supply; (b) aspect; (c) position; (d) surrounding objects; (e) subsoil.

4. What do you understand by temporary and permanent hardness of water? Describe how the temporary hardness of water may be removed; also explain a method which would remove the temporary and diminish the permanent hardness.

5. What precautions should be taken in storing rain water for a domestic supply? and give any rule you may know for calculating the size required in a storage tank.

6. Draw a cross-section of a concrete floor, supported by British standard steel beams, to a room 30 feet by 20 feet, with figured dimensions of concrete and beams, and state the proposed composition of the concrete.

7. Describe the best form of w.c. for houses, for factories, for schools and for hospitals. Illustrate by sketches.

8. In planning a system of drains, what gradients are necessary for the following sized pipes to insure a velocity of 2 feet per second:—(a) 9-inch, (b) 6-inch, (c) 4-inch—and give examples of calculations to arrive at your answer?

Manchester, November 18 and 19, 1904.

1. What do you understand by convection, conduction and radiation of heat respectively? Give examples and explain the phenomena of each.

2. Give the various subsoils of sites for dwellings. Which are porous and which are impervious? What other considerations affect the choice of a site for a dwelling?

3. Give the formula for determining the velocity of water under a head of pressure. How is this modified to meet the case of water flowing through an orifice?

4. State various ways in which a cast-iron water main may be coated to prevent corrosive action by the water. Give sketches and describe joints in wrought and cast-iron pipes.

5. Describe the construction of hollow walls, the ties employed, the distances apart. Sketch a vertical section of a hollow wall with damp course and footings.

6. Give a sketch of a hot-water heating scheme for a four-storeyed house of twenty rooms, and show how and in what directions the circulation is maintained.

7. What is meant by natural ventilation, and upon what physical laws does it depend?

8. Describe any method you know of treating sewage from a country house where no sewerage system exists.

London, December 9 and 10, 1904.

1. Describe the action of an ordinary siphon, also that of an inverted siphon carrying sewage under a river.

2. What changes take place in a gas when it is heated? How can such changes be measured? Compare the changes in air and water produced by increasing the temperature of both from 60 degs. F. to 220 degs. F.

3. Contrast from a health point of view dwellings upon (a) well-wooded hills, 500 feet above the sea; (b) fen land; (c) the southern slope of a range of hills. Show how reasonable hygienic conditions can be obtained in each position.

4. It is required to deliver one gallon of water per second through a pipe 150 yards long, with a head of 72 feet, what diameter will be required? Show the working.

5. Give a short description of Portland cement, also blue lias lime. Describe their manufacture and the class of work to which each is applicable.

6. What do you understand by the plenum and the vacuum systems of ventilation? Discuss the pros and cons of each for (a) a large schoolroom; (b) a laundry; (c) a dry-glaze factory.

7. State briefly the steps to be taken to effectively examine and test a system of drainage twenty-five years old.

8. What are the biological processes concerned in the resolution and purification of the organic matters in sewage.

CONSTRUCTION OF TUNNELS.

At the meeting on the 14th inst. of the Institution of Civil Engineers, Sir Guilford L. Molesworth, K.C.I.E., president, in the chair, the papers read were:—"Alfreton Second Tunnel," by Mr. E. F. C. Trench, M.A., and "The Reconstruction of Moncreiffe Tunnel," by Mr. D. McLellan.

ENGINEERS,

Park Works, Newton Heath, **MANCHESTER.**

Queen Anne's Chambers, Westminster, **LONDON.**

The Alfreton Second Tunnel was undertaken in 1899 as part of the Midland Railway Company's scheme for widening their main line in Derbyshire. The new tunnel is 90 feet from the old, and, like it, is half a mile in length. The tunnel cuts through the coal measures, and several beds of coal were met with, from which fuel for the contractors' engines was obtained.

Owing to the extensive cuttings required at both ends of the tunnel, it was not possible to attack it from the ends; five shafts were therefore sunk on the centre-line, and from these the whole of the tunnelling was done. The tunnel was driven of full size in both directions from each shaft, but when the working-faces had approached to within 2 chains of each other, a small heading was driven through, in order that the alignment and levels might be checked. In no case was there any appreciable error, although the only instrument used for setting out the centre-line was an ordinary 5-inch transit theodolite.

The tunnel is built of red bricks procured in the locality, and is faced internally with best Staffordshire brindle bricks. The thickness of the tunnel-ring is 2 feet 3 inches, except for a few lengths in which it is 2 feet 7½ inches, and the shaft lengths, which are 3 feet thick. Most of the tunnel was worked in lengths of 15 feet, but at one point these had to be reduced to 12 feet, owing to extra pressure on the timbering.

A good deal of water was met with in driving the tunnel, and in order to drain this away from the working-faces, earthenware pipes were laid below the invert. The permanent drainage of the tunnel is effected by means of a 2-foot brick culvert built on the invert. For turning the arch of this culvert, centring mounted on a trolley was used. This effected a considerable saving in time, and rendered it possible to build the culvert at the rate of 44 lineal yards per day. The drainage of the shafts is effected by means of earthenware pipes built in behind the brick lining of the shafts and tunnel, and discharging into the tunnel at rail-level. The water which accumulates around the shaft-lining is collected and led to these pipes by means of brick "garlands" encircling the shaft-linings just below the water-bearing strata.

The brickwork at the intersections of shafts and tunnel

consists wholly of blue bricks in cement, the arris being formed of special bricks made to the proper angles. The permanent way through the tunnel consists of 100 lbs. rails, which, before being laid, were painted with four coats of red-lead paint. The ballast is of slag.

Special care was taken in designing and building the tunnel fronts to avoid the failures which sometimes occur at these places. The face-wall was built to a batter of 1 in 6, and in order that the brick courses of the tunnel-ring might be brought in normally to this batter, the tunnel was given a bell mouth, the vertical axis being increased in length by 2 feet at the face. To increase the longitudinal strength of the tunnel hoop-iron straps were built between the brick courses at each face.

The time occupied in building the tunnel was nearly two years. The works were carried out at the direction of the company's engineer, the late Mr. J. A. McDonald. The contractors were Messrs. Thos. Oliver & Son, and Mr. Trench acted as resident engineer.

Moncreiffe Tunnel, on the Caledonian Railway, near Perth, is 1,218 yards in length, of which, before reconstruction, 842 yards were lined with brickwork and 376 yards were unlined. The reconstruction was necessitated by the deterioration of the brickwork of the lined portions since the tunnel was built in 1848, and the disintegration of the rock at some of the unlined portions resulting in pieces falling on to the rails.

The reconstructed tunnel has 1,083 yards lined with brickwork, the remaining 135 yards being unlined. Advantage has also been taken of the reconstruction to enlarge the internal section of the tunnel and to raise the rails so as to give room for more ballast between the bottom of the sleepers and the rock formation. The new section has vertical side walls and a segmental arch, and admits of the passage of the largest west coast joint stock with open doors. The minimum thickness of the side walls is 9 inches and that of the arch 18 inches, the average thicknesses being 1.66 foot and 2.06 feet respectively. The lining is faced with blue brindle bricks.

The water in the surrounding ground, which finds its way to the brickwork lining of the tunnel, flows down the extrados of the arch into channels leading to chimney drains built in the side walls. It escapes from the chimney

drains through fireclay pipes built in the walls, and flows to either end of the tunnel through larger fireclay pipes laid on the formation close against the side walls.

The temporary works were situated at the north end of the tunnel, the chief of them being a protective overhead platform, a cement shed, a 3-ton derrick crane, and electric light and air plant. The overhead platform, besides being a convenience in dealing with the excavated and building materials, served to protect the traffic on the railway from the jib of the crane when in use. The cement shed was capable of holding 100 tons of cement. The electric lighting and air plant supplied light for the whole tunnel during the operations, and fresh air for the workmen, who, without it, would not have been able to remain in the tunnel for a reasonable time, owing to the presence of smoke emitted by engines passing through.

While the reconstruction was in progress the traffic was worked on a single line of rails laid in the centre of the tunnel. The actual work of reconstruction inside the tunnel was carried on with the aid of four steel travelling shields, the principal dimensions of which were 32 feet long, 22 feet wide and 16 feet 8 inches high. There were openings through the shields, 13 feet 8 inches wide and 13 feet 6 inches high, for the passage of the trains. These openings were lined with timber, which served as a protection both for the traffic on the railway and for the workmen engaged on the top of the shield. Each shield consisted of two parts, which were connected rigidly together with bolts, and which could be taken apart if necessary. Small trolleys running on narrow-gauge lines conveyed the excavated and building materials between the base of operations at the north end of the tunnel and the shields. They were assisted on Sundays, during the cessation of ordinary traffic, by waggons on the running line.

The reconstruction of an originally unlined portion of tunnel was comparatively simple, owing to the ground being rock. The shields merely acted as a protection, and were scarcely ever required to carry any load other than the weight of the workmen and of the building materials. The side walls were built clear of the shields, and ordinary tunnel centres were used for the building of the arch.

In the reconstruction of an originally lined portion of

tunnel in soft ground, the old brick lining was supported off the leading end of the shield. A top heading was driven over the extrados of the old arch to allow of the two centre crown-bars being drawn. Then the old arch was removed, commencing at the crown, and the length was timbered as in ordinary tunnelling, the bars being supported at their back end off the new brick arch and at their front end off one of the ribs of the leading half of the shield. When a 12-foot length was completely excavated and timbered, the rear half of the shield was detached and moved back to the last length, to be used as a scaffold in connection with the removal of the timber centres. While the two portions of the shield were apart the opportunity was taken of building the side walls. Then the rear half of the shield was moved forward with the centres, which were erected in their new position, and another length of brick arch was built.

Alarm-bells connected with the signal-boxes outside were provided at seven different points in the tunnel, and there was also telephonic communication between the middle of the tunnel and the same signal-boxes. The drivers of engines were instructed to prevent as far as possible the emission of smoke and steam when passing through the tunnel and to sound their whistles.

The time taken to complete a 12-foot length of originally unlined tunnel was seven days. The corresponding time for a 12-foot length of originally lined tunnel in soft ground was eleven days, and for a 12-foot length of originally lined tunnel in rock eight days. The average progress was 15 lineal yards per month per shield, the best progress of any one shield being 18 lineal yards per month.

The operations were carried on continuously, working night and day and on Sundays. There were three 8-hour shifts of miners in the twenty-four hours and one shift of bricklayers, the number of men employed daily being 150. The reconstruction work proper inside the tunnel was commenced on January 27, 1902, and was completed on December 25, 1903. Single-line working through the tunnel was brought into operation on December 1, 1901, and double-line working was resumed on March 6, 1904.

The work was carried out by the Caledonian Railway Company, under the direction of Mr. Donald A. Matheson, C.E., assisted by Mr. McLellan, Mr. W. A. Kemp acting as resident engineer.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

LAMBETH.—March 30.—For municipal buildings at Brixton Hill. Particulars from Mr. H. J. Smith, Town Hall, Kennington, S.E.

NELSON.—March 4.—Designs for a free public library. Premiums of 50*l.*, 25*l.* and 15*l.* Mr. J. H. Baldwick, town clerk, Town Hall, Nelson.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—March 6.—For the erection of vicarage for St. James's Church, Ashton-under-Lyne (stone building). Messrs. Thos. George & Son, architects, 7 Warrington Street.

ASHTON-UNDER-LYNE.—March 6.—For seating and sundry repairs, also for painters' work, required at the Corporation baths. Mr. J. T. Earnshaw, A.M.I.C.E., borough surveyor, Town Hall, Ashton-under-Lyne.

BARKISLAND.—March 18.—For rebuilding the Barkisland Mill bridge, Barkisland, near Halifax. The County Surveyor, County Hall, Wakefield.

BARMING HEATH.—March 14.—For infectious hospital, day-room, bays to additional buildings, alterations and additions to laundry and other works at the Barming Heath asylum, near Maidstone. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

BECKENHAM.—March 20.—For the erection of two cottages for firemen in Westbourne Road, for the Beckenham Urban District Council. Mr. John A. Angell, surveyor.

BEVERLEY.—March 7.—For additions to Little Tranby, Beverley. Messrs. Botterill, Son & Bilson, architects, 23 Parliament Street, Hull.

BIRSTALL.—March 10.—For the erection of a small-pox hospital at Birstall, for the Oakwell Joint Hospital Board. Mr. Wm. Middlebrook, clerk, 70 Huddersfield Road, Birstall, near Leeds.

BLACKHILL.—March 8.—For the erection of three self-contained dwelling-houses, three-stalled stable, cart shed, &c., in Blackett Street, Catchgate. Mr. W. B. Barron, 3 West View, Blackhill, Durham.

Published EVERY FRIDAY by GILBERT WOOD & Co.
LTD., at the Offices, 6-11 Imperial Buildings, Ludgate
Circus, London, E.C.

WALSALL.—March 6.—For the erection of a senior mixed department for 300 children, together with a classroom for fifty infants and sundry alterations to the present boys and girls' schools. Messrs. Bailey & McConnal, architects, Bridge Street, Walsall.

WALTON-ON-NAZE.—March 6.—For the erection of new schools at Walton-on-the-Naze for 200 children. Mr. F. Whitmore, architect, Duke Street, Chelmsford.

WASHINGTON.—March 24.—For Primitive Methodist school and vestry at Washington Station, Durham. Messrs. Davidson & Phillipson, architects, 32 Clayton Street West, Newcastle-on-Tyne.

WOKINGHAM.—March 13.—For the construction of bacteria filter beds, and other works in connection therewith, at Wargrave. Mr. Richard Hassard, 1 Victoria Street, Westminster.

WORSBROUGH BRIDGE.—March 4.—For the erection of three houses on Park Road, at Worsbrough Bridge, Yorks. Mr. Arthur Whitaker, architect, Worsbrough Bridge, Barnsley.

WORTLEY.—March 18.—For widening Wardsend Goit bridge, on the Sheffield and Halifax main road. County Surveyor, County Hall, Wakefield.

WREXHAM.—March 22.—For the construction of sewage disposal works, including settling tanks and percolating filters, formation of road, laying land, also 9-inch sewers, &c., for Acrefair, Cefn-Bychan and Newbridge, in the parish of Cefn, near Ruabon. Mr. J. Price Evans, Argyle Chambers, Wrexham.

An effort is being made to finish the new promenade at Blackpool by Easter, and the Corporation have settled a strike of carters by agreeing to pay 7d. a ton for sand carted and tipped behind the sea wall.

The Pennsylvania Railway Company will, it is said, spend 30,000,000 dols. in the construction of a new railway station at Chicago; of this sum 20,000,000 dols. will be spent in acquiring land and 10,000,000 dols. will be spent on buildings. Plans and specifications have been completed, and show a group of supply and storage warehouses, a large freight warehouse and a passenger depot.

MESSRS. NORTON & GREGORY, LTD., have published a humorous description of their premises in Westminster, where photo-copying, architectural photography, lithography, process engraving, drawings, perspectives, tracings, mounting and framing, modelling and typewriting are carried on. Four years ago it appears the firm occupied two small back rooms on a top floor. Recently they have had to erect spacious premises covering the site of the old Stag Inn.

BUILDING AND BUILDERS.

THE Liverpool Cathedral committee decided on Monday to proceed with the erection of the building upon scheduled prices and not upon a lump sum contract.

ABOUT eighty petitions have been presented against the administrative county of London electric power bill—a speaking testimony to the ambitious nature of this enterprise—which seeks to afford to the whole of London a cheap supply of electricity “in bulk.”

THE Manchester City Council having declined to entertain the proposal to purchase the gardens of the Royal Botanical and Horticultural Society at Old Trafford, the Council of the Society decided last week to sell the gardens to the highest bidder. It is understood that the property is likely to be soon purchased as building sites.

THE Glasgow Institute of Architects have adopted the following clause regarding repairs after electrical work proposed by the Institute of Measurers for embodiment in specifications of contracts was approved of, viz.: “The contractor to do all mason, brick, joiner, plaster, and other works required to carry out and complete his contract, and to make good at his own expense all damage caused by his operations, and he shall be bound to employ the plasterer engaged on the job at the usual jobbing rates.”

THE Aberystwyth Harbour breakwater has been completed at a cost of over 13,000*l.*, and at a recent meeting of the Town Council the engineer and contractor were formally thanked. Mr. Walmsley, the engineer, informed Mr. Lester, the contractor, that no other contractor could have done the work so well. The structure would stand as a breakwater, and if they wished to make a promenade they had only to add a parapet. The work had been completed within the revised estimate, although it had exceeded the original estimate. The contract was for 10,500*l.*, and the total cost was 13,375*l.* 11*s.* 6*d.*

DISSATISFACTION being expressed at the use of cement as specified in the roadway on the new middle pier at Pittenweem Harbour, which is near completion, the Commissioners agreed to form same with causeway instead, as being more serviceable for the traffic. Messrs. Gray & Sons, the contractors, with the approval of the engineers, con-

sented to carry out the alterations without any extra cost on the condition that they could deposit the hardest of the excavations and surplus stones from the interior of the harbour on to the west beach instead of taking same out to sea as provided by their contract.

ELECTRIC NOTES.

THE Handsworth Town Council have decided to borrow 45,000*l.* in connection with the electric lighting scheme.

THE Troon Town Council have resolved to ask the makers of destructors to specify the cost of providing complete in every respect a two-cell destructor.

THE Board of Trade have granted the application of the Pollokshaws Town Council for an electric-lighting order, with power to transfer it to the Corporation of Glasgow. It is expected that the work of erecting the necessary plant will be carried through during the incoming summer.

ARBITRATION proceedings have been commenced between the London, Deptford and Greenwich Tramways Company and the London County Council in reference to a claim for compensation for loss of traffic caused by the operations of the Council in the construction of their electrical lines at the Tower Bridge approach crossing the lines of the company. Major-General Hutchinson, C.B., R.E., is the arbitrator appointed by the Board of Trade.

THE consulting electrical engineer to the Liverpool Corporation in his annual report on the electric supply department, stated that owing to various funds having to be provided for, and a material rise in the price of fuel, the engineer does not think any general reduction in charges could be prudently made, but recommends that, to encourage a more extensive use of electrical energy for power purposes, the price after 3,000 units per quarter (which are charged at 2*d.* per unit) should be reduced from the present rate of 1½*d.* to 1*d.* per unit. He also recommends that in some special cases where arc lamps are used in the daytime for medical or other purposes, and not for lighting, the charge, subject to a guaranteed minimum consumption, should be made on the power scale.

“MAXIMUM LIGHT GLASS.”

THE ONLY DAYLIGHT INCREASING WINDOW GLASS COMBINING LENSES AND PRISMS.

DARK INTERIORS

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

MAXIMUM LIGHT GLASS - -

Is supplied in sheets for glazing like ordinary window glass.

Also in ornamental patterns glazed in lead.

And in crystal tiles framed in copper.

MADE LIGHT.

The electricity committee of the Aston Town Council have resolved to abolish the two-rate system of charge, and in substitution have adopted the following rate of charges for the supply of electrical energy for lighting purposes, viz.:—Consumption under 300 units per quarter $3\frac{1}{2}d.$ per unit; 300 but under 600, $3\frac{3}{4}d.$; 600 but under 1,000, $3\frac{1}{2}d.$; 1,000 but under 1,500, $3d.$; 1,500 but under 2,000, $2\frac{3}{4}d.$; 2,000 units and upwards, $2\frac{1}{2}d.$

The Croydon County Council, by twenty-two votes against seventeen, have decided to withdraw from its Bill the proposal to extend the electric tramways to Upper Norwood and the Crystal Palace. There was recently a poll of the borough on the subject, and a majority of only eighty-eight was given in favour of the Bill out of nearly 7,000 votes recorded, the tramways proposals being the real issue. The chief opposition came from the frontage owners of Upper Norwood.

The Carlisle Tramways Company were informed at the annual meeting that the result of last year's working had been less satisfactory than that for the previous year. This was entirely attributed to the extra cost incurred in making the experiment of a ten minutes' service during the first three months of the year. They had hoped that as they were giving a more frequent service the Corporation of Carlisle would make a substantial reduction in the price of the electric current, but these anticipations were not fulfilled.

A SAFETY device for the protection of persons from the electric current upon the rupture of a trolley wire has been placed on the market. By the employment of this arrangement the current is cut off and the wire rendered harmless.

The device is fitted to each section of the wire, and consists of an ordinary connecting ear, held in its proper position by the strain on the trolley wire. Directly this tension is released, as by the breaking of the trolley wire, the current is immediately cut off the broken section.

THE parliamentary committee of the London County Council have prepared a report on the Administrative County of London and District Electric Power Bill and the East London and Lower Thames Electric Power Bills, in which it is proposed to supply electrical energy over a wide area. The matter is declared to be of the utmost importance. It is stated that "the proposals in respect of which powers are sought are such as to constitute a serious menace to existing and future municipal electrical supply undertakings, and leave the Council no alternative but to oppose the Bills."

THE new first-class battleship *King Edward VII.*, which was commissioned at Devonport, contains several important innovations in her electrical equipment, which is the most complete and exhaustive so far installed in any warship afloat. The power motors number over 100, varying from 50 horse-power for working the capstan and coal hoists, of which there are seven, to those for driving the electric fans which will purify the air in confined spaces. Motor power is also utilised for working the ammunition supply, lathes and machines, hoisting in coal from lighters or colliers, pumping water to the bath-rooms and cookery departments, clearing the boiler-rooms of ashes, mixing dough in the bakery, &c.

THE Columbia University School of Architecture is to be reorganised on the atelier system in vogue in the schools of Paris. The changes have been under consideration for the last two years. By the action taken the standard of the school will be raised, so that after July 1, 1905, it will become an advanced school. Admittance will be granted only to those who have spent not less than two years in some approved school or college. Professor A. D. F. Hamlin, now adjunct professor of architecture, is promoted to be professor of the history of architecture and placed in charge of the architectural school.

VARIETIES.

SIR RALPH LITTLER stated at a meeting of the Middlesex County Council that the model of the King Edward VII. Bridge at Kew had obtained the gold medal for bridge-building at the St. Louis Exhibition.

MODELS of the chair made out of the foundations of old Kew Bridge, and accepted by His Majesty the King in commemoration of the opening of "King Edward VII." Bridge at Kew in 1903, have been presented by Mr. Chancellor to the Surrey and Middlesex County Councils.

THE Durban Town Council will advertise for tenders for the erection of municipal buildings. The contractors are to belong to Durban, Maritzburg, Johannesburg, Cape Town, Port Elizabeth, Bloemfontein, East London or Pretoria; the date of receiving the tenders to be six weeks from the date of the advertisement. The estimated cost of the buildings is 320,000/.

THE plans submitted by Messrs. Briggs & Wolstenholme and Mr. Arnold Thornley for the Wallasey town hall, to be erected on the North Meade estate, Seacombe, which were awarded the first place for merit in the recent competition, have been approved by the works committee. The architects have amended the drawings to include a tower on the promenade elevation.

MR. WEMYSS has resolved to build a wet dock adjoining Buckhaven Harbour at a cost of from 150,000/ to 200,000/. It was thought that a tidal harbour would be suitable, the depth of water being nearly 30 feet, but on going more minutely into the matter, the surveyors decided that it would be better to have a wet dock. According to the plans, which are now being submitted to the contractors, there will be a depth of water of 27 feet on the sill at ordinary tides, and 25 feet at neap tides.

TRADE NOTES.

MESSRS. DOULTON & Co., LTD., of the Royal Doulton Potteries, London, have been selected to supply the whole of the sanitary fittings, and to carry out the plumbing work at the sanatorium now being erected for His Majesty the King at Midhurst, Sussex.

MESSRS. OETZMANN & Co., of 62 to 79 Hampstead Road W., announce that they have purchased the entire stock of Messrs. Norman & Stacey, Ltd., of 252 to 256 Tottenham Court Road, and are now removing it to their own show-rooms and galleries in Hampstead Road, and that all goods are marked in plain figures at the lowest possible prices for cash.

MESSRS. WM. POTTS & SONS, clock manufacturers, Leeds and Newcastle-on-Tyne, are erecting a first-class clock and chimes at the ancient abbey church, Blunsdon, Wilts. They have also a clock with four illuminated dials and bell for Gloucestershire, and a clock with two external dials for Herts, and a new clock with two large external dials for Fulham Town Hall, London, S.W.

ASPINALL'S ENAMEL, LTD., as a company are always endeavouring to meet new requirements. They have paints which are admirably adapted for use by amateurs. Their new "Sanalene" is an enamel paint which is intended for practical work by practical users. It is to be applied as if it were a high-class varnish, and each coat must be thoroughly dry before another is applied. If properly laid on, the surface has a marvellous sheen, and yet it is found to resist wear. It is supplied in several colours, but special colours can be matched to order. All the materials employed are chemically pure.

POSSIBLY the most perfect damp and time-resisting materials existing are lead and bitumen. Lead is so well known that comment is unnecessary, and for 5,000 years the mummies of Egypt have been preserved in their wrappings of bitumen, which must not be confounded with pitch or tar. These materials are encased by Messrs. Watson & Co., of 119 Victoria Street, S.W., in a double layer of asphalted felt covered with sand, which serves as a cushion to shield the lead and bitumen from injury, and gives a key to the mortar. The Reliance lead and bitumen damp course is made in 15-yard lengths to any width, and is easily laid and joined. It is claimed for it that it does not crack or squeeze out, is pliable as leather and absolutely impervious to damp. No pressure can injure it and it may be bent to any angle with safety. We understand that it is specified by H.M. War Office, the Admiralty, Office of Works, and for many large contracts in London and the provinces.

CORRESPONDENCE.

Waterproofing Concrete.

SIR,—In a late issue reference is made to a lecture by Mr. W. H. Finley, C.E., in which he alludes to a German waterproof cement for use in concreting, &c. Recognising the value of such a material, we took steps to secure the English rights, and did so, but in practice found it no improvement on ordinary cement, and at once stopped the sale of it. Our lead and bitumen damp course is conceded by many important authorities to be the best medium for rendering concrete waterproof. It does not curl or blow like asphalt, and the face being covered with sand, a key is provided to which the cement in the concrete adheres.

Your obedient servants,
WATSON & Co.

119 Victoria Street, Westminster, London, S.W.,
February 23, 1905.

SIR,—We are obliged by your reference to the air-lift pump on page 22 of your current issue. Permit us to point out, however, that this pump is fitted at the Midland Hotel, Birmingham, not Reading.—Yours faithfully,
THE PULSOMETER ENGINEERING CO., LTD.
Reading, February 25, 1905.

NEW CATALOGUES.

THE reputation of the St. Pancras Ironwork Company is so well established that contractors will be glad to learn that they are now turning their organising power, plant, and general facilities to the manufacture of steam motor vehicles. The wagons are not merely adapted for conveying heavy goods, but they can be arranged to suit special circumstances, and, if necessary, can have a tip body. The boiler is of such a size as to have a reserve of power, and consequently there can be no breakdowns. The tanks hold enough water for a run of from fifteen to twenty miles, they are easily guided, and they comply in weight with the new regulations of the Local Government Board. One of the vehicles, capable of carrying 7 tons twenty miles a day for five days in the week, makes the cost of carriage not more than twopence per ton mile. The new vehicle

meets a want which contractors have not hitherto been able to meet unless at an enormous expense.

SOME new catalogues of their mouldings, cornice, picture and dado rails, architraves, cappings, handrails, skirtings, staircases and other worked wood have been issued from the Albert Works, Newbury, belonging to Messrs. Elliot. They make architects' designs a specialty and submit estimates for every description of joinery according to architects' designs. The mills of the company are among the largest in England and possess the most perfect machinery that is obtainable. None but thoroughly dry and seasoned wood is used. The majority of the designs are registered. It is also an advantage to have a number of Gothic mouldings. Messrs. Elliot have been successful in securing the services of Mr. Edward Buckingham as general manager, and, as he is a thoroughly practical man of untiring energy and exceptional capabilities, the high reputation which the firm has enjoyed for so many years will be fully maintained under his guidance.

THE catalogue of the G. W. Lewis Tileries, Ltd., presents a variety of roofing tiles, ridges, ridge-tops, finials, besides flooring tiles and chimney-pots. They are a class of goods which is now largely demanded, and all the examples are of satisfactory form. The hip tiles will be especially useful; tables of weights and prices are given, and they will be found to be inexpensive.

At the present time every manufacturer who has to employ steam power must encounter two serious difficulties. A large number of official and unofficial personages are ready to invoke the law against him if by any diminution of combustion at a high rate thick smoke should be found to issue from his chimneys for a few minutes. He has also to remember economy, and cannot employ more fuel than is necessary to secure a certain amount of power; or, in other words, there must be a close relation between the work done by every ton of coal and the quantity of steam which is produced. That is to say, much depends on the character of the stoking. Manual labour for that purpose is costly, it is laborious, and it is rarely uniform. Mechanical stokers are consequently

sought after. What is known as the Bennis stoker, which is manufactured by E. D. Bennis & Co. Ltd., Bolton, is simple in arrangement, does not need skilled superintendence, and is efficient. It consists of a hopper with an ingenious arrangement of a feeding-box and a shovel-box with patent pneumatic gear, by which the fuel is distributed in sections over the fire; there is, therefore, no possibility of that superabundance which is not only wasteful, but creates thick smoke. The stoker is used in some of the largest works in England, and its power is unquestioned.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

At the rooms of the above Society, on the 25th ult., Mr. Maurice B. Adams read a paper on "Public Libraries, their Building and Equipment. A Plea for State Aid." Mr. C. B. Bulmer, president, was in the chair.

The lecturer said that this was a paper mainly dealing with the requirements of to-day, and therefore, by way of introduction, there need be no hesitation in claiming indulgence if he emphasised the importance of a comprehensive, not to say a liberal-minded, survey of the whole question of library legislation, presenting as the subject does one of the contemporary problems of our time. Retrospectively, the story concerning the origin of libraries and their subsequent history abounds in incidents of the utmost interest. The earliest libraries known were the famous "Record Office" at Kouyunjik, founded more than twenty-five centuries ago; and the library of the great temple at Nippur, discovered four years ago by Dr. Peters, of New York, carries back Babylonian civilisation to 7,000 B.C., though no document was found at Nippur of later date than 2,280 B.C.; and the great library of Pergamon, founded 200 B.C., and contained 200,000 volumes. Prior to entering upon any discussion about the special arrangement of library buildings, it will be convenient briefly to allude to the subject of library provision in its wider aspect. This reference brings us face to face with the stern realities of what is called the "penny rate," which was fixed more than fifty years ago; but as the law now stands, any town can by a special Act of Parliament

augment its penny rate for library purposes, and twenty-eight boroughs, with satisfactory results, have done so. It requires little imagination to realise what a direful struggle to make ends meet in many a small town must be experienced with only a penny rate, and in most places the attempt is practically impossible. If in fairly big towns the penny rate is not enough, the whole thing in villages becomes preposterous, and the lecturer thought that the Board of Education should have powers to include library enterprise when making grants for educational purposes. The system of State aid for libraries obtains in Canada, Australia, South Africa, and the United States. The Central Library at Boston, U.S.A., cost 473,000*l.* and contains 800,000 books, with ten branch libraries besides, averaging 20,000 volumes each. The yearly cost of maintenance is 52,000*l.*, out of which the city purse provides 47,000*l.* We now come to the initial question in the planning of a public library as to the respective proportion of space which should be allowed to the different departments, in allocating the available superficial area. A roomy and even spacious entrance hall is essential. According to the usually accepted *régime* in proportioning the floor area of a library with a closed lending department, the following allocation of space for every 10,000 feet superficial has been recommended, viz., 3,000 square feet for newspapers, 2,000 square feet for magazines, 2,000 square feet for the reference department, leaving 3,000 square feet for the lending library. With regard to the position of the librarian's room, I think he ought always to be next the reference room and close to the lending library.

STRENGTH OF CONCRETE FLOORS.

The Long Island Storage Warehouse in Brooklyn was designed by Messrs. Helmle, Huberty & Hudswell. The building is 120 by 125 feet in plan and 113 feet high. The steel columns carry I-beam girders 15 feet apart which are connected every 24 inches by 3½-inch Columbian ribbed bars laid across their top flanges. These bars are put in place with the other steelwork, and serve as bracing for the girders as well as reinforcement for the floors. The floors are 5 inches thick, and made of 1 by 2 by 5 concrete with

ashed furnace slag; this material is also used around the beam girders as a protection against fire. The ceilings will be painted with cold-water paint, applied directly to the reverse side of the floor-slab without plaster.

During construction two entire bays of the floor were accidentally loaded with cement. The load was about 100 lbs. per square foot, and produced a deflection of 1 inch in one bay and $\frac{1}{2}$ inch in the other. After the removal of the load the deflection decreased in the first bay 1 inch, and increased in the second to 5-16 inch, but later recovery reduced the permanent set to $\frac{3}{8}$ inch and 3-16 inch in the two bays. The floors were designed for a load of 100 lbs. per square inch, with a factor of safety of four, in accordance with the system of the Columbian Fireproofing Company.

SIR WILLIAM ARROL, M.P., ON ART.

THE art exhibition promoted at Ayr by the Carnegie Library Committee and the Ayr Sketch Club was formally opened on Saturday by Sir William Arrol, M.P. In the course of his remarks Sir William Arrol said that although he bought many pictures he could not say that he was an art critic. The critics were, like the pictures, of varied qualities. He could not say that he was much of a critic of art, but he had a great liking for pictures. There was one thing certain, and that was that a good picture always sold well, and there were more pictures being sold at the present day than ever before, and that showed that there was an increasing taste for good art. The dealers always said that they could sell a good picture well, but the difficulty was to sell bad ones. That, he thought, was a very encouraging sign. It was the duty, and it ought to be a pleasure, for everyone to encourage art. It was an education and a pleasure both for those who produced objects of art and those who admired their work. A perfect piece of ivory carving had recently been dug up in Egypt, the representation of the head of an Egyptian king, which was supposed to be 7,000 or 8,000 years old, and there were a great many examples of Egyptian art that were 5,000 years old, which showed that the Egyptians had a high conception of art. And coming to a much later period they had the art of the Greeks and Romans. In

later times they had still many examples of pictorial art of 200 and 300 years ago, and it showed the increasing appreciation of those pictures that they were now worth fifty times as much as when they were produced. He did not like a picture the meaning of which you had to go to the catalogue for. A picture should always plainly tell its own story. There was one picture in his house that a gentleman friend of his often came to see, and brought others to see it, it was so bright, and there were others of his pictures that he never tired looking at. Art was an interesting and engrossing study, and he thought it should be encouraged in every possible way. The other day he visited an exhibition of Dutch pictures in London. No doubt they were very good pictures, but he thought them rather cold—there was plenty of water in Holland. In an adjoining room he came across a picture by Patrick Naismith and others by Fraser. It was like going out of a dark room into one flooded with sunshine. Then last week he saw Watts's pictures. Watts was a great artist, and they were grand pictures; but for ordinary people who were not artists there was, he thought, a coldness about them. Now, in his opinion, pictures that were to hang in a house ought to be cheery. Nothing raised the spirits more quickly than a beautiful picture, and nothing put the spirits down readier than a dull and melancholy picture. Speaking of the impressionist school, he said he must confess that he did not think the new Glasgow school an improvement on the old. They gave you an impression of colour, but you required to ask the artists what it was meant to be. Their pictures sometimes reminded him of the kind of door that he used to see at a village cartwright's. They used to paint the inside of the carts white, the outside green, and the bottom red, and the apprentice who did the work, having only one brush, cleaned it on a door. In that way they sometimes got a very pretty blending of colours, and if they went far enough back they could imagine, perhaps, that it represented a "coo." That was pretty much the impressionist school. He thought when they had a picture on the wall they should not require the artist to explain to them what it was about. He liked to see well-proportioned pictures and beautiful colouring as near nature as possible, because there was nothing prettier than nature. He did not wonder that there

should be so many followers of art in Ayr, because they had such an enormous number of opportunities of looking at beautiful sunsets. He had never seen anything anywhere to equal the sunsets seen from Ayr when the sun was setting behind the Arran hills. Sir William wished the exhibition every success.

THE FUTURE BIRMINGHAM.

A PAPER was read by Mr. William Henman before the Birmingham Architectural Association on "The Future of our City." He said people little thought of the effect of architecture on the character of a town or city. That was only too apparent. Notwithstanding many excellent qualities possessed by the people of important centres there was an absence of a collective taste in art. Individual taste and artistic spirit existed, but this failed in its effect through a want of collective appreciation. They must do something to broaden this artistic spirit, and to create an interest in the architecture of our streets, so that an ugly building offended as would a discordant sound. After giving his impressions of Birmingham on his first visit thirty-three years ago he observed that he hoped he might say without hurting the susceptibilities of those native to the city that there was still ample room for improvement. There had been too much self-gratification displayed since Birmingham was called the best governed city in the world. Mr. Henman asked his hearers whether, from an architectural standpoint, Birmingham had kept reasonable pace with its prosperity?

Mr. Henman showed a plan of a proposed improvement of the approach to the city from Edgbaston by a road running through the Old Wharf in a line with Paradise Street and entering Broad Street near the Children's Hospital. He submitted this scheme to the then borough surveyor (the late Mr. Till) in 1884, but at that time the Town Council had shortly before had the Corporation Street scheme in hand, and were not prepared to embark upon any great street improvement. The canal and railway systems also added to the difficulty. Mr. Till was, however, greatly impressed by the advantages which the scheme offered.

The new Corporation Street might, continued Mr. Henman, be made an ornament to the city or the very opposite. He regretted that the street was begun under the Workmen's Dwellings Act rather than as a street improvement. The line adopted for it was by no means the best available. Many of the streets crossed at awkward angles, and the older streets were damaged as business thoroughfares. They must be thankful for its construction, however, in that it had provided an airy thoroughfare and had given character to the city. Through the kindness of Mr. Joseph Hill Mr. Henman was able to place on the screen maps showing the development of the city, and spoke of the inconvenience caused by the lack of through streets, reminding one more of a spider's web than of a well laid-out city. The city authorities and the land and property owners might unite to make Birmingham what it ought to be. He suggested improvements between Paradise Street and Five Ways, and on land between the Prince of Wales Theatre and Easy Row in the neighbourhood of the Crescent he saw a site for the new cathedral, clergy house and other public buildings. Easy communication could be obtained between the centre of the city and Bordesley by a continuation of New Street.

The Lord Mayor and General Phelps, who were present, spoke in appreciation of the paper, and a vote of thanks was passed to Mr. Henman, a supporter of the motion suggesting that the Birmingham Corporation might do worse than imitate the municipal body of Brussels in offering prizes to architects giving the best frontages to their streets.

VENTILATION OF THE HOUSE OF COMMONS.

SOME important recommendations for improving the sanitation of the House of Commons are contained in the report just presented of a prolonged investigation conducted last session by Dr. M. H. Gordon, with the assistance of Dr. W. H. Huntley, Demonstrator of Public Health Chemistry at St. Bartholomew's Hospital, and Dr. J. Aitken, at the request of the First Commissioner of Works. Dr. Gordon entertains the view, says the *Times*, that the present air-inlet should be raised and widened, and that a systematic survey of the structure of the building might

to the discovery of some way in which this end could be attained without unduly interfering with the façade. In case, he advises that traffic over the north inlet should be abolished. For the purpose of purifying the air he suggests that the moistening spray should, in future, be applied regularly instead of occasionally; and as further measures of precaution he would like to see the three openings between the ventilating fan and the inlet removed or made absolutely airtight, traffic across the airway entirely prohibited while the House is sitting, shallow pans of water (kept scrupulously clean) and, if possible, wet mats or sponges, suspended in the battery chamber over the heating apparatus so that the increased avidity for moisture which obtains through its temperature being raised should be satisfied, all steam pipes passing through the airway between the inlet and the floor of the chamber covered with asbestos or suitable composition for isolation, and the pans continuous and complete hygrometric records kept. Having pointed out that it is as important to prevent the air of the debating chamber from becoming too damp as it is to prevent its being too dry, Dr. Gordon proceeds to emphasise the necessity of checking pollution from material brought in upon members' boots and from particulate contamination by material given off in the breath. In the latter connection he admits the superiority of the upward system of ventilation, but, holding that there is a possibility of devising some means of dealing more effectively than at present with particulate contamination, he recommends vigilant watchfulness. With regard to the floor covering of the House, he has come to the conclusion that the string carpeting now in use is liable to injury by steam, and therefore only formalinises the air admitted—a disinfecting process that kills some but by no means all of the micro-organisms. The question consequently arises whether it would not be wise to substitute hair-matting, seeing that steam, as applied in the modern way as a steriliser, kills all micro-organisms at a single exposure. In conclusion, Dr. Gordon recommends the more effectual withdrawal of air from the legislative chamber at the end of the ceiling over the Speaker's chair and the Ladies' Gallery, the clothing of all attendants employed between the air-inlet and the floor of the House in clean white linen or drill, and the maintenance of a daily chart or record with the object

of securing uniform efficiency in the ventilation of the building.

During the recess the recommendations of the Select Committee of the House of Commons with reference to the ventilation have been carried into effect, with the exception of the completion of the extract fan. This has been delayed by reason of structural difficulties incidental to the floor of the Commons Lobby Chamber, but it is expected that this fan will be running within a month from date. The principal improvements already effected are (1) the complete washing of the air by means of a new type of water screen; (2) the erection of a much more powerful intake fan; (3) the more effective isolation of passages joining the main airways. This will be followed by experimental tests having in view the better distribution of air to the Chamber, and also by tests of the air so distributed. It is hoped that the works already completed will result in a very considerable improvement in the quantity and quality of the air supply.

PIG-IRONS.

A PAPER was read on Saturday by Mr. E. Adamson, before the Manchester Association of Engineers, on "Pig-irons and their Use in the Foundry and Forge." The practical difference in pig or cast iron was, he said, more in degree than in kind, and to manufacturers faced with a variety of specifications pig-iron and its contents present an unending subject of instructive and interesting study, which the relentless march of scientific investigation renders imperative if the finished goods are to hold their own in the world's markets in quality and in price. Pig-iron is divided into kinds or classes—that is, made from different ores. Certain of these are subdivided into hot and cold blast and refined irons, and all are further divided into grades or numbers, which are usually distinguished by the fracture. The historical side of the manufacture of iron has been so ably treated by Percy in 1864, and since by Turner and the late Sir I. Lowthian Bell, as well as others, that it is perhaps wonderful in these days to read a recent remark which fell from the lips of a well-known man, giving as the reason for the closing of so many inland ironworks

that the heart of England is not the place for a trade which is dependent on foreign ore. But the lecturer pointed out that iron ores are found in many, including inland districts, and this is the cause of pig-iron being made in different parts of the country. These pig-irons have become known by the district in which they are made. He presented a table giving each class of iron and its ore supply. He discussed the difference between hematite pig-iron made from British and foreign ores, quoting the researches of Professor Arnold and Mr. J. E. Stead on the influence of copper and arsenic, adding that there was little doubt that in the absence of specific knowledge and accurate information on these points both copper and arsenic have been made the scapegoats of careless, faulty, and perhaps sometimes ignorant manufacture, and that where no evident cause of failure has been readily traceable, the presence of these elements, if detected, has been eagerly seized upon, and as readily accepted as a sufficient explanation; but, when put to the test, it is found that both may go free, and that in such quantities as usually found in pig-iron they are at least harmless, if not beneficial. Further tables contained typical analyses of the various classes of foundry and forge pig-irons made in this country, and the lecturer stated that the reason for the differences in quality, analysis for analysis, was governed by the methods of manufacture. He maintained that irons could be obtained in this country quite equal to any which are imported. He stated that both in the foundry and forge the question of grading was most important. He first quoted West's tests, showing how grading by fracture is not reliable, and after fully describing the difficulties of so grading, he gave an example of the grading adopted in the United States by silicon contents, which is a sufficient guide in ordinary cast iron where no test is specified. He went fully into the use of "glazy," or the more euphonious American designation, "silvery," iron, which many founders are afraid to use because of its somewhat resembling the true white iron; and gave curves showing how it was really at the other extreme to white iron, and that it is a matter of simple arithmetical calculation in silicon contents as to how much glazy or silvery iron can be used in any given charge. He stated that the reason why the Americans can work so well on analysis is that nearly all their ironfounders employ a

metallurgist, and he quoted from Mr. Souter's paper on the metallurgical engineer, given before the American Iron foundrymen's Association, on the value of the services of such an expert.

In discussing the question of special castings to meet specified tests, he pointed out that pig-iron has two distinct conditions—the one chemical and the other mechanical each being independent of the other. He quoted instances of actual tests from pig-iron of almost identical analyses—the one giving 41 and the other 21 cwt., transverse test on a 2 by 1 bar, with 3.0 centres, and maintained that West's tests upheld this opinion. He stated that the mechanical condition, which is governed by methods of manufacture, is no doubt the explanation of the difference between cold-blast and refined irons, against hot-blast irons. The methods under which cold-blast and special irons are made tend to produce in these irons a smaller molecular structure. Hence their grading must necessarily be somewhat different, as, generally speaking, these irons have a lower silicon content, number for number. For instance a No. 1 cold blast will be much closer than a No. 1 hot blast, as will also Nos. 2, 3, 4 and 5. A series of hot and cold blast samples sent by the Lilleshall Company for the lecture were here referred to. The lecturer said that, in addition to these fractures, there are also two fractures of the identical number (a No. 4)—the one is hot and the other cold blast. No. 4 is usually subdivided, as No. 4 foundry and No. 4 forge, but these have been selected as representing the same subdivisions of No. 4 as comparisons purely. In outward appearance to a casual observer there is no difference, but on closer inspection it will be found that the cold-blast sample has a much greater "pull" than the other, and on the polished back it will be observed that the cold blast is close in grain even in the centre of the pig, whilst the hot-blast pig shows much more open in the centre on the polished surface, which is the true test of close tests. Hot-blast irons are different in analyses and molecular structure, but by suitably selecting and refining, both these conditions can be obtained. Generally, the refined irons will be lower in sulphur, which is not an objectionable feature, and in Mr. Adamson's experience these have given much higher mechanical tests than ordinary cold-blast irons.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE
TO THE
ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO.
becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders

and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

COLCHESTER.—April 13.—For school in Mill Road, Mile End. Block plan to be obtained from Mr. C. E. Denton, Educational Offices, Colchester.

LAMBETH.—March 30.—For municipal buildings at Brixton Hill. Particulars from Mr. H. J. Smith, Town Hall, Kennington, S.E.

SWINDON.—April 14.—The education committee of the Town Council of Swindon propose to erect a public elementary school with accommodation for 840 scholars, and invite plans from architects. Mr. W. Seaton, Secretary to the Education Committee, Education Office, Town Hall, Swindon.

CONTRACTS OPEN.

BARKISLAND.—March 18.—For rebuilding the Barkisland Mill bridge, Barkisland, near Halifax. The County Surveyor, County Hall, Wakefield.

BARMING HEATH.—March 14.—For infectious hospital, day-room, bays to additional buildings, alterations and additions to laundry and other works at the Barming Heath asylum, near Maidstone. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

BECKENHAM.—March 20.—For the erection of two cottages for firemen in Westbourne Road, for the Beckenham Urban District Council. Mr. John A. Angell, surveyor.

BIRMINGHAM.—March 20.—For alterations to the female epileptic block at the infirmary, Dudley Road, Birmingham. Mr. W. H. Ward, architect, Paradise Street, Birmingham.

BIRMINGHAM.—March 20.—For erection of a fire station at Bordesley Green. Mr. John Price, city engineer and surveyor, the Council House, Birmingham.

BARHAM.—March 16.—For the supply and fixing of three iron exterior staircases at the Barham workhouse. Mr. R. M. Cook, clerk, Union Offices, 6 Providence Street, Ipswich.

The "ARMORDUCT" STEEL CONDUIT SYSTEM is the only complete System manufactured; it possesses many features not to be found in any other.

Apply for NEW LIST:

The ARMORDUCT CO., 6 Farringdon Avenue, London, E.C.

BRADFORD.—March 13.—For the joiner, slater, plumber and plasterwork required in four houses, Toller Lane. Mr. J. W. C. Atkinson, architect, 1 Ivgate, Bradford.

BURTON-UPON-TRENT.—March 14.—For alterations to the town hall. Mr. Henry Beck, architect, 10 High Street, Burton-upon-Trent.

BURY ST. EDMUNDS.—March 18.—For the erection of a secondary school and pupil teachers' centre at Bury St. Edmunds for 210 scholars. The County Architect, Sudbury, Suffolk.

CARDIFF.—March 13.—For the construction of a public convenience in Allensbank Road, Cathays. Mr. W. Harpur, borough engineer, Town Hall, Cardiff.

CARLISLE.—For the whole or any part of the works required in the following contracts:—New front elevation and other alterations to the Liverpool Arms, English Street, shop and warehouse, St. Cuthbert's Lane; laundry (except machinery and fittings) for the Crown and Mitre hotel. Messrs. Oliver & Dodgshun, architects, Carlisle.

CARLISLE.—March 20.—For the erection of a caretaker's lodge and boundary wall at the Robert Ferguson schools; Denton Street. Mr. Henry C. Marks, surveyor, 36 Fisher Street, Carlisle.

CASTLETON.—March 14.—For the erection and furnishing of a branch library at Castleton, Rochdale. Mr. Jesse Horsfall, architect, 4 Chapel Walks, Manchester.

CHESTER-LE-STREET.—March 18.—For the erection of an inspector's house and office, with cottage, at Chester-le-Street, Durham. Mr. Stephen Wilkinson, architect, 30 Mosley Street, Newcastle-on-Tyne.

CHIPPING NORTON.—March 21.—For the erection of a bridge at Chipping Norton Junction and the reconstruction of a bridge at King's Sutton, for the Great Western Railway. The Engineer, Paddington Station, London.

COBHAM.—March 22.—For the erection of a laundry (fitted with certain appliances for hand-power only) at the isolation hospital, Whitehill Road, Cobham, near Gravesend. Mr. Archibald E. Loach, 8 Northcote Road, Strood.

CLEATOR MOOR.—March 14.—For the erection of two shops and dwelling-houses at Cleator Moor, Cumberland. Mr. Edmund Jackson, C.E., Tangier Buildings, Whitehaven.

CROMER.—March 13.—For the construction of an engine-house, boiler-house, chimney shaft, cottage, and other works in connection therewith, at the site of the new pumping station at Metton, near Cromer. Mr. J. C. Melliss, engineer, 264 Gresham House, Old Broad Street, E.C.

DERWENT.—March 27.—For the construction of the Grindleford to Rowsley section of the Derwent aqueduct, in the county of Derby. The work will comprise—tunnels, about $\frac{1}{2}$ mile; cut and cover, about 4 miles; 45-inch pipe laying, about $4\frac{3}{4}$ miles, with valve-houses, stream crossings, &c. Mr. Edward Sandeman, engineer, Bamford, near Sheffield.

DUNDALK.—March 16.—For building a dwelling-house on St. Mary's Road, Dundalk. Mr. John F. McGahon, architect, Roden Place, Dundalk.

EDINBURGH.—March 11.—For executing the following works in the erection of Drummond Street school, for the Edinburgh School Board:—(1) mason and brick work; (2) carpentry and joiners' work; (3) smith and ironfoundry-work; (4) slaters' work; (5) plasterers' work; (6) plumbers' work; (7) painters' work. Mr. Carfrae, architect, 3 Queen Street, Edinburgh.

EGREMONT.—March 22.—For the conversion of buildings into two cottages at Egremont, Cumberland. Mr. James Cowan, surveyor, Egremont.

ENFIELD AND WILLESDEN.—March 13.—For the erection of caretaker's quarters on a site adjoining the magistrates' courts, Enfield; also for the erection of caretaker's quarters on a site adjoining the magistrates' courts, Willesden. Mr. H. T. Wakelam, county architect, Middlesex Guildhall, Westminster, S.W.

EXMOUTH.—March 11.—For the erection of four houses at Mamhead View, Exmouth. Messrs. Crews & Son, Rolle Street, Exmouth.

GLASGOW.—March 13.—For work to be executed in the reconstruction at Bridge Street station, Caledonian Railway Co. Company's Engineer, Buchanan Street Station, Glasgow.

GLASGOW.—March 13.—For the rebuilding of the station offices on the down-line platform at Whifflet low-level station, for the Caledonian Railway Company. The Company's District Engineer, 16 Killermont Street, Glasgow.

TRADE NOTES.

THE Columbian Fireproofing Company, Ltd., 37 King William Street, London, E.C., have been successful in securing the contract for floors and roofs in the new elementary schools, Kingston-on-Thames. Another of their contracts is the steelwork (and floors in the new power-house for the sugar refiners, Messrs. Tate & Son, Silvertown.

In the Shipping Trust Building, Cockspur Street, of which Mr. Henry Tanner is architect, the stonework, which is the best Whitbed, has been supplied from the quarries of the John Pearce Company, at Portland, and worked by the Bath Stone Firms, Ltd., at their masonry works on the island, all under the supervision of Mr. Mitchell and the Waring White Building Company. The building will be visited by members of the Architectural Association on the 25th inst.

THE additions to the union infirmary, Chipping Norton, are being warmed and ventilated by means of Shorland's patent Manchester stoves and Manchester grates.

MESSRS. LONGMANS, GREEN & Co. are introducing some improved drawing implements for architects in D. A. Low's improved tee-squares and set-squares. The blades of the

tee-squares are formed of thin pine and celluloid, with the result that a very light article is produced, and one that seems to promise less difficulty in keeping drawings clean. The blades are supplied with either ebony or transparent celluloid at choice. Framed set-squares are also produced of similar construction to the blades of the tee-squares. A very useful article too is "Low's Vector Set-square," with which both rectangular and raking lines can be drawn with the same implement.

THE Great Central Railway Company have decided to work the branch line between New Holland and Barton-on-Humber by motor-cars, and the new system will be brought into use immediately. The motor-cars will carry about sixty passengers each, namely, forty-five third and fifteen first class. Experimental runs have been made on the Cheshire lines with most satisfactory results both as to speed, cost and comfort.

THE Eccles Town Council have approved of plans of municipal workmen's semi-detached cottages, and will make application to the Local Government Board for a loan. By the provisional order granted by the Local Government Board for the acquisition of the insanitary area of Eccles, the Corporation have to erect cottages for the accommodation of 340 persons dispossessed by the demolition of old cottages. The health committee propose to make provision for 230 persons, leaving 110 still to be provided for. The Corporation having no desire to compete with private owners, the rents of the cottages will be regulated according to the charges made for adjoining buildings.

THE Johannesburg Master Builders' Association at their first annual meeting agreed "That all master men connected with the building trades be eligible for membership in the Association." It was also resolved that the committee be instructed to approach the Architects' Association regarding the guaranteeing of quantities, and uniformity in getting them out; also that the contractor has the importing of materials, as specified, to carry out the building and the completion thereof; and, further, that there be uniform conditions of contract throughout Johannesburg. The entrance fee is to be reduced from 5*l.* 5*s.* to 2*l.* 2*s.*, the annual subscription remaining at 5*l.* 5*s.* a year.

NEW CATALOGUE.

We have often commented on the remarkable communis-
tiveness among all classes of people in the United States
affording information. Trade and office secrets which
have been acquired by study, labour, and it may be expense,
are found printed in books and journals as if apprehensions
of rivalry were unknown across the Atlantic. The cata-
logue "P" of the Standard Manufacturing Company, of
Pittsburg and London, is an example. All the illustrations
are presented in such a way that similar forms and arrange-
ments could be introduced by other manufacturers. If
viewed merely as an example of illustrating and printing,
the book is a marvel. Indeed, some would consider it
deserves to be regarded as a work of art, for it shows how
advanced America is in matters which are often carelessly
neglected in England. The descriptions and prices are
precise, and the volume is sufficient to exemplify the
advanced state of sanitary appliances in America and the
remarkable ingenuity exercised in even the simplest kind
of apparatus. Evidently the owners of houses are willing
to expend more money on sanitation than is usual in
England, and the Standard Company provide them with
goods which are not only efficient but luxurious.

OPPOSITION is being raised to the proposal of the Lan-
cashire Asylums Board to erect a new asylum at Whalley
at a cost of between 250,000*l.* and 500,000*l.* The Bolton
Town Council will be invited to convene a meeting of the
representatives of the county boroughs to formulate the
opposition and report to the respective councils.

ELECTRIC NOTES.

THE Derby electric tramways, of which the first section
was opened in July last, are to be extended at a cost of
19,245*l.* The Town Council propose to purchase four cars
for 2,320*l.* The cars at present earn on an average 10½*d.*
per mile, and the total receipts are 505*l.* per week.

THE municipal electricity works at Bridlington, York-
shire, were opened on the 2nd inst. They were designed
by Mr. E. R. Matthews, borough engineer. The electrical
work has been carried out under the superintendence of
Mr. F. A. Medhurst, consulting electrical engineer, Man-
chester and London, and Mr. Arthur J. Beckett, who
officiated as clerk of the works during the progress of the
undertaking, has been appointed electrical engineer. The
scheme has been carried out at a cost of 30,000*l.*

THE Finchley District Council will apply to the Local
Government Board for raising a loan of 23,500*l.* for
extending the electric light. Tenders will also be invited
for the various items, which are made up as follows:—
Buildings and sub-station, 6,750*l.*; machinery, 5,450*l.*;
water supply, 2,180*l.*; mains, 5,370*l.*; service connections,
2,200*l.*; contingencies, office and inspection expenses and
loan charges, 1,500*l.*

MR. J. H. DOBSON, formerly an apprentice in the Crewe
Railway Works, has been appointed to the professorship of
electro-technics at the Transvaal Technical Institute,
Johannesburg. Mr. Dobson won a scholarship at Crewe
Mechanics' Institute, proceeded to University College,
Liverpool, was afterwards appointed head of the engineering
department at the Gamble Institute, St. Helens, and last
year went to South Africa with Professor Hele-Shaw.

ARRANGEMENTS have been made for the construction of
the first entirely electrically driven cotton-spinning mill in
this country by the Acme Spinning Co., Ltd., of Pendlebury.
It will contain 41,000 mule and 34,000 ring spindles, as well
as the usual preparation machinery. The supply of electri-
city will be three-phase alternating, obtained from the
Lancashire Electric Power Co.'s trunk mains. It will be
produced at their generating station at Outwood by steam
turbines driving 10,000 volt dynamos and transmitted at
this pressure to the mill, where it will be transformed down
to 400 volts for the motors and 230 volts for lighting.

VARIETIES.

THE Chelsea town hall extension committee are in favour of a scheme of enlargement which Mr. Leonard Stokes, the architect, estimates will cost over 17,000*l.*

A MEMORIAL to Henry Cort, the inventor of the process of rolling iron, was unveiled in Hampstead parish church, Church Row, Hampstead, yesterday, by the Chairman of the London County Council, Mr. J. Williams Benn, M.P.

THE Walsall Board of Guardians have accepted a recommendation of the building committee that no further action be taken with a view to laying down brick-making plant, as the Guardians could buy all the bricks they required for less than the machinery would cost.

Six women tracers have, it is stated, been appointed for duty in the drawing-office at Chatham dockyard, and six for the drawing-office at Sheerness yard. A chargewoman has also been appointed to each yard to take the oversight of these new employees. Other women tracers will be selected later on.

THE Thames Conservancy Board granted on Monday permission for the construction at Stone of a timber quay about 6,600 feet long and 58 feet wide, and ten transport sheds each 300 feet long and 61 feet wide. It is stated that the construction of the new wharf at Stone will cost about 1,000,000*l.*, and that the wharf will allow of 6,000,000 tons of traffic being handled.

ON Tuesday a Local Government Board inquiry was held at King's Heath by Mr. R. H. Bicknell into an application by the King's Norton and Northfield Urban District Council for sanction to borrow 13,000*l.* for the erection and equipment of public baths in that district. It was stated that the site was very central to serve a population of 24,000 people in Selly Oak Ward. The work was commenced in January last.

A PARLIAMENTARY return issued on the 7th inst. states that the total number of Bills deposited for the Session of 1905 relating to railways, canals, tramways, and the supply of electricity, gas, and water is 131, as compared with 159 of the Session of 1904. The total money proposed to be raised is 47,470,914*l.*, as compared with 37,825,761*l.*, an increase of 9,645,153*l.*

A PARLIAMENTARY return just issued summarises the accounts of the gas companies for the year 1903, and shows that the number of such companies continues to increase. In 1882 there were 352 undertakings, and they sold 45,484,000 thousands of cubic feet of gas to 1,055,000 consumers. In 1903 the undertakings numbered 459, with a paid-up capital of 67,417,000*l.*, and they supplied 93,923,000 thousands of cubic feet of gas to 2,385,348 consumers. There has been an equally noteworthy increase in the number and size of gasworks owned by local authorities.

KING EDWARD DOCK, Gibraltar, will be used for the first time by a first-class battleship when *King Edward VII.* is docked there. This is the first and smallest of the three large new graving docks to be brought into use. It has a depth of 35½ feet of water over the sill at low water. The width of the entrance is 95 feet, and the length on the floor of the dock is about 450 feet. It is only just able to take this huge battleship. The dock is closed by a travelling caisson worked by hydraulic power, and the capstans and senstocks or sluices are also worked by the same hydraulic installation. The other two larger docks will, it is expected, be in use by the end of this year. These docks form part of the great Admiralty scheme of dockyard extension and of harbour improvement which has been in progress for some years, and which is now rapidly drawing to a conclusion. The three moles and the dredging are practically completed; so, also, are the enormous workshops which have been built on reclaimed ground. The total cost of the Works Loan scheme will be about 5,000,000*l.* sterling.

BUILDING AND BUILDERS.

THE Ancrum Road school, Dundee, is to be enlarged at a cost of 7,500*l.* The plans, by Mr. J. H. Langlands, have been approved by the Education Department.

THE Barrow Town Council are considering a scheme for the erection of a central police court and police station at a cost exceeding 16,000*l.*

THE committee of the Manchester City Council appointed to consider the advisability of establishing a works department of the Manchester Corporation decided on Monday to

tain information on the matter from other corporations, including county councils.

At the meeting on Tuesday of the London County Council the question was asked whether it was intended to continue the Building Act Amendment Bill now before Parliament, in view of the fact that some eighty petitions had been presented against the measure. Captain Hemphill, chairman of the Building Act committee, said he could not answer that question. The number of petitions against it was no criterion of the strength of the opposition, which might be confined to a clause here and there.

PLANS for the new Edinburgh slaughter-houses and markets to be erected at Gorgie have been presented, so far as the proposed railway sidings are concerned, to a joint sub-committee of the Lord Provost's and markets committee of Edinburgh Town Council. There was, it is understood, a feeling among the members of the committee that the plans were too elaborate for first requirements, and it was agreed to remit them to the railway companies for reconsideration.

The Holland Railway Company will receive tenders up to March 27 for the following work:—Contract No. 8: The construction of groundworks, artificial works, hardening works, enclosures, buildings, the laying of the superstructure, the construction of the ballast bedding and of additional works for the reconstruction of the Helder-Amsterdam railway, in connection with the widening of the railway bridge over the North Sea canal, near Zaandam (nieuwe Hembrug), in two lots, the total being 87,333*l*.

The erection of a large paper-mill at Healing, Lincolnshire, is in contemplation. On Monday, before the Grimsby Rural District Council, Mr. H. C. Scapeing, architect, submitted plans for the drainage of the proposed mill direct from Healing to the Humber. Mr. Scapeing stated that his clients' scheme involved an expenditure of from 80,000*l*. to 100,000*l*., and would provide regular employment for about 300 men. The Council decided to submit details of the scheme to counsel before taking further action.

The parish church of St. Teilo, Llandilo Fawr, Carmarthenshire, was reopened by the Bishop of St. Davids on Friday, March 3, after the addition of a new organ chamber, and after being thoroughly restored and renovated

from the designs and under the supervision of Mr. David Jenkins, F.R.I.B.A., architect, Llandilo. The general contractors were Messrs. Thomas Brothers, of the same town. Contractors of specialties:—Messrs. Roger Lowe, Ltd., Farnworth, for the maple wood-block flooring; Messrs. W. Godwin & Son, Hereford, for the encaustic and tesselated tile pavings; Messrs. Wake & Dean, Ltd., Yatton, Somerset, for the oak choir stalls; Messrs. Alfred Gardiner, Sons & Co., Ltd., Bristol, for the brass altar rails and standards; Messrs. Richard Williams & Son, Llandilo, for the cleaning, varnishing and gilding work; Mr. D. Pritchard Davies, Llandilo, the installation of electric light; Messrs. Saunders & Taylor, Ltd., Manchester, the heating apparatus; Mr. G. Vowles, Bristol, the rebuilding of the organ. The aggregate cost was 2,500*l*., and the restoration generally is acknowledged to be a decided success.

FINANCING BUILDING OPERATIONS.*

The methods of financing building operations vary in different places. In New York many schemes have been adopted for a while to give place at length to other methods.

For example, when apartment-houses were first introduced they became very popular. Then what was known as the co-operative apartment-house scheme was invented. The promoters would get the refusal of a piece of land, have plans drawn and organise a company of people who wanted homes. The plan was to give the owner of a certain amount of stock a perpetual lease of an apartment (very similar to the custom in Venice of different floors in a building belonging to different owners). A great many large apartment-houses were built on this scheme, but after one notable instance in which the mortgage was foreclosed and the stockholders wiped out this method was abandoned.

Formerly much of New York city was built on leasehold property, and many of the finest stores are on leased land, such as those of A. T. Stewart (now John Wana-

maker's); Tiffany & Co., Union Square; W. & J. Sloane and others. But at the present time very little is loaned on leasehold, and it is almost impossible to finance a large proposition in New York if the fee of the land is not included. This is not the case in Chicago, where many very large and high buildings are on leased ground.

Most of the dwellings in the large cities of the world have been built by operators building rows of similar houses and selling them separately. This form of operation appeals to a large number. Men of small capital can start in a small way, and by investing their profits in more houses, often build whole neighbourhoods. They are usually successful during rising markets. Of course, houses reproduced a number of times can be built more cheaply than separate houses. The plan of finance is often to employ an "architect" to make the plans of one house, a building loan is then procured, and the different sub-contractors are induced to wait for their final payments until some of the houses are sold.

But there are many builders who build very good houses to sell in New York, and a large number of fireproof residences have been built and sold, and not a few have brought between 100,000 dols. and 200,000 dols. each in the last few years. There are very few private residences built at present on Manhattan Island, apartment-houses being the vogue.

In the financing of a building operation, the promoter has usually to provide the difference between the amount of money that can be borrowed on the enterprise and the cost of it. The permanent loan is usually made by a financial institution on a conservative basis, loaning only 50 or 60 per cent. of the value of the enterprise at a low rate of interest. If the conservative institutions decide not to loan money, there is very little promoting done until they again wish to loan. Of course, there is a great deal of money loaned by private individuals, but such loans are generally of smaller amounts.

There are institutions which make a business of loaning and selling the mortgages to private individuals. Thus the financial institutions have the first claim on most enterprises. They decide whether there will be an active business or not. If they are desirous of loaning, there are always operators who are anxious to promote enterprises.

As the size of operations in America has increased to such enormous proportions, so have construction companies, promoting companies and realty companies been formed with very large capital. Some of these have increased their scope until now they will underwrite the mortgage, assist in financing the whole operation and build the building. This class of operation is almost exclusively confined to central and staple property.

A popular mode of procedure, for a man who wishes to operate in real estate is to form a company, usually called a realty company, and for each particular building operation a subsidiary company is formed by the parent company, which method, under the laws of the State of New York, eliminates the element of personal liability of the stockholders.

There is a large field for these realty companies, managed on conservative lines, and they are of great advantage to people who are forced to improve their property. It may be that their buildings are too poor to compete with new neighbours or too old, or that they have been destroyed by fire, &c., or for other reasons. For example, a man has a piece of property in a business centre which he is forced to sell or improve, and which is appraised at, say, 1,000,000 dols.; it does not carry itself, and there is not a ready sale for it at that price. A realty company might make the following proposition, viz.:—To erect on it a building costing, say, 1,000,000 dols.; to pay him for his land 600,000 dols. in cash and 400,000 dols. in second-mortgage bonds of the company. The realty company would borrow from a financial institution, say, 600,000 dols. on the land, and, say, 500,000 dols. on the building as it progresses. After paying the owner 600,000 dols., they would have 500,000 dols. in cash for the building, and the stockholders would have to put in the balance, 500,000 dols., and own the equity. In some instances the company issues no second-mortgage bonds but only stock.

There are many men who are forced to sell or improve their property, and while they have not the means to improve it themselves, they would prefer to keep an interest in it to selling it altogether, and they also feel that the experts in the realty company know better than they what the nature of the improvement should be. Perhaps the owners are not in this country, or perhaps they are not in a

to wish to take much trouble in posting themselves the requirements. Some propositions like the above, in which they retain naturally appeal to them. Of course, if the realty puts in very little cash, it may prove a poor ion for the owner of the land, as he is taking most of k and had better get most of the profits. The financing of large building operations has been in very much the same lines as railroads are financed, issuing bonds and stock in shares of, say, 100 dols. Also large operations have been put through in I am told, by selling only stock in small shares, at the property being bonded, and again other large ions have been successfully carried out by selling mortgage bonds in small amounts. The stock in such tance represents no payment in cash, but professes to unt the earning power over expenses. These plans have not been popular in New York. al estate has increased so much in value in large cities would not be possible for most men to invest in it, if e not through these companies. While formerly only ch were able to participate in large enterprises, now, gh the large corporations, the people can be interested the great enterprises of the country. ilding-loan corporations in great numbers have been d for persons who wish to build homes. Under their he tenant gets the property upon the payment of a small equity. He then, in lieu of rent, may pay off month a small portion of the mortgage, in addition to rrying charges. e questions, How much will a building cost? and a will it be finished? are of the greatest importance to ancier. These questions depend largely on the labour ions, on which subject the architect and his client, the r, are not usually given a chance to be heard, although viter is the greatest sufferer from strikes and lock-outs. terest account is going on all the while, and he has much more at stake than the builder. company that could give a good guarantee to finish a ng at a certain time for a certain amount of money l, indeed, greatly facilitate any building operation. Let pe that this may soon be the case. is not the province of the architect to formulate the

financial scheme or to place the securities of the project. He may be called upon to design a new building, introduc- ing features which will make it superior to its competitors. He is usually expected to prepare preliminary plans, specifications, and to give an estimate cost of building, carrying charges and operating expenses in the shortest possible time. He should be familiar with all requirements of the building he is called upon to design. He should theoretically not put anything in that is not of use. He should at the same time make his building pleasing to the public, without adding unnecessarily to the cost.

Assume, for instance, that it is proposed to finance the construction of a high office-building in some great centre. To insure a good income, the requirements, above the first or second storey, would probably oblige the build- ing to have as many windows as possible—not too large to be easily operated, and yet as large as practicable. Each window should be separated from each other window, preferably by masonry, as it is advisable to have as little steel as possible exposed to the elements, but steel thoroughly covered with cement masonry is supposed not to deteriorate. Projections over adjoining property should be dispensed with, to avoid legal complications. Many title-guarantee companies discriminate against such en- croachments. A large cornice is a disadvantage to windows under it. Therefore, the requirement which confronts the architect is a flat wall pierced with windows at equal intervals, like a waffle-iron, and not even relieved by a large projection.

Although this is a difficult proposition, it is certainly a very interesting one.

The high building is essentially American. It is a new proposition, and requires more originality to solve than a problem where some historic example from the Old World may be taken as a prototype.

Would it not seem as if these requirements might best be met by the clever application of colour? If someone could use bright-coloured terra-cotta, for example, omitting large projections but with a handsome sky-line, and so make a beautiful building, he would indeed deserve the thanks of the community. For the skyscraper has come to stay, and the business centres of our large cities will be rebuilt. The Egyptian, Greek, Roman, Romanesque and Gothic archi-

pects all felt the want of colour and used it, and although colour had perhaps better not be suggested by an architect until he is quite sure that he will be employed, it seems to be a subject for serious consideration.

It is of the greatest importance to have the description of a proposition as brief as possible, but covering all the points. A résumé of the specification is of great benefit.

OLD CHURCH ORGANS.

In Halesowen churchwardens' ledger for the year 1497 appears the following item:—"Paid for repeyling the organs to the organ maker at Bromycham, 0-10-0"—which seems to indicate, says a correspondent of the *Daily Post*, that the craft of organ building had located itself in Birmingham at that early period.

In the scheduled possessions of the Birmingham Guild of the Holy Cross at the time of its suppression in 1545, there is an entry of "the fee of William Bothe, pulsatoris organi," the organ being that of the parish church of St. Martin. But Walsall Church boasted an organ of which there is even an earlier mention. In 1486 the "Meyre and his bredours (brothers) of Walshale" petitioned their patron, Sir Henry Verdon of Haddon, to appoint "Sir (or Rev.) William Fysshier" as their chantrey priest, "bothe to maynteine and uphold ovr organes and ovr choere (choir) with ovr grete labour moved."

At the dissolution of Halesowen Abbey in 1539 it appears that the organ was removed to the church, for in the accounts are found these two entries:—

"Paid my lord abbot for the organs . . . 4 marks.
Mending and setting them up . . . 40 shillings."

The organ at Sutton Coldfield Church was erected at the cost of Bishop Vesey about this time, in the reign of Henry VIII. Then came the Reformation. In an inventory of church goods taken in 1552 by order of the "Reforming" Council of Edward VI. it was reported that Brewood possessed "one peyre of organys," and also at Lichfield there was "one payre of organs." In Wolverhampton Old Church the organ occupied a gallery which replaced the ancient rood-loft; for it was not till after the Reformation that the

organ and choir were generally removed to the west end of the churches. How few of the pre-Reformation organs remain it would be difficult to hazard a guess. One interesting specimen of these old-world instruments was served in the chapel attached to Haddon Hall. The destruction that went on during the Civil Wars was lamentable. The Puritanical decree issued in 1644 that no music to be allowed in the churches beyond "plain psalm singing" and that all organs were to be "taken away and utterly defaced" accounts for the destruction, among hundreds, of those at Lichfield, Birmingham, Wednesbury, Wolverhampton, Walsall and Sutton. Just previously (1634 to be explicit) it had been recorded of Lichfield, a traveller who was touring through England, that on reaching that city he attended prayers in the cathedral, where "the organs and voyce were deep and sweet," and the music the most melodious description. To the Puritanical mind it was an abomination that—

Some to church repair,
Not for the doctrine, but the music there.

It would almost seem that special visits were paid to some outlying places for the express purpose of destroying the organs and other objectionable church fittings. The ancient organ which stood at the entrance to the chancel of Wednesbury Old Church is reported to have been willfully destroyed by the fanatical soldiery of Cromwell, although there is no record of military operations nearer to that town than Dudley. At Walsall the organ was burnt with a lot of other church property in the open market-place.

Under the conditions which prevailed in Puritanical England, as may easily be imagined, organ-building languished as a decaying industry. But with the Restoration of Charles II. in 1660 a revival speedily set in. It may be said that all our fine old organs date from the period of the Restoration. Practically, it was then we got that noble form of organ which has been designated "the king of instruments," the organ which remains to this day a musician's delight.

With flying fingers, as they lightsome bound,
From brazen tubes he draws the pealing sound,
Unnumbered notes the captive ear surprise,
And swell and thunder as his art he plies.

ut it was long ere all the churches and cathedrals were
 lied; the demand was great and the skilled workmen
 few. In the Temple Church, London, two organs
 set up, one on each side, in a contest for supremacy.
 een two famous builders; Bernard Schmidt, otherwise
 her Smith, and Renatus Harris. Although such
 us players as Dr. Blow and Mr. Purcell performed on
 ne, and Mr. Lully, organist to Queen Catherine, on the
 , the contest was carried on for over a twelvemonth, at
 end of which Lord Chief Justice Jeffreys, was
 aled to, and gave his decision in favour of Father
 h's organ, and that instrument stands in the Temple
 ch to this day. The rival instrument, though in no
 disparaged, came into this district. According to Hone's "Table Book," it was purchased
 nd set up in Christ Church Cathedral, Dublin. In the
 of George II., an English maker named Byfield was
 for to repair it; but he prevailed on the Chapter to
 a new one made by himself, he allowing for the old
 in exchange. When he got it he offered it to the
 shioners of King's Lynn, but they preferred to have a
 one built by Snetzler, at a cost of 700*l*. Byfield then
 g, his widow sold Harris's famous organ to the church-
 fens of Wolverhampton for 500*l*, and there it remains
 is day. In 1776 it was declared to be "one of the best
 ern organs ever touched."

ather Smith was the builder of the organs for St. Paul's
 Westminster Abbey, for the cathedrals of Worcester
 Lichfield, and for other great fanes. That he built for
 field is said to be now in the possession of Mr. Josiah
 le, of Armitage. The oldest organ which remains in
 riginal condition is said to be that at Barnsbury Street
 gregational Chapel, Islington. A very fine and hand-
 e organ was also built by him for Walsall Church.
 instrument had to be repaired in 1726, and in 1772 it
 sold for the small sum of 12*l*. 10*s*. to a Walsall
 eman named Mr. George Hill, who built a room in his
 en for its reception. He afterwards sold it to the
 chwardens of Stowmarket, in Suffolk, for 50*l*, and it
 luty in the church there for many years afterwards.
 organ of St. Mary's, Warwick, was built in 1730 by
 mas Swarbrick.
 Half a century ago Birmingham possessed the second

largest organ in England; it was the splendid instrument
 erected at a cost of 2,000*l*. in the Broad Street Music Hall
 (now Prince of Wales Theatre), and afterwards purchased
 for St. Pancras Church, London.

AMERICAN ENGINEERING.

A CORRESPONDENT of the *New York Tribune* in London,
 in a recent letter wrote:—As an exiled American,
 very proud of my own country, yet discreet enough
 to prefer to have foreigners blow the trumpets for her,
 I have had a happy hour this week at the Institute of
 Civil Engineers, where Sir William White described in the
 handsome assembly hall the recent visit of the British
 delegation of engineers to the United States. The hall was
 crowded with members, and every tribute to American
 energy and hospitality was received with hearty applause;
 and when the great naval architect referred with admira-
 tion and enthusiasm to the marvels of engineering
 in and around New York it was fortunate that
 the lights were turned down, for the sake of the
 lantern slides, else I would have been betrayed in my
 place as a triumphant Yankee, exultant and unabashed.
 It was an informal and unpretentious record of the experi-
 ences and impressions of the British engineers who crossed
 the Atlantic last autumn and took an active part in the
 congress at St. Louis, after inspecting the subway, bridges,
 river tunnels, sky-scrapers and Croton Dam in Greater
 New York, and making flying excursions to Canada, Chicago
 and the Great Lakes; but the note of sincerity and good
 feeling vibrated through it, and every expression of grateful
 appreciation was caught up by the members, who knew
 how kindly their representatives had been received in
 America, and how much they had seen to inspire them
 with respect for the many mighty engineering works of
 their colleagues across the seas. Americans are in
 the habit of saying that Westminster Abbey, Shakespeare
 and all the noble traditions of English history and literature
 belong to them as much as to the insular Britons. These
 English engineers have learned that the converse is also
 true; that their own mechanic art has been carried to the

 Excelsior and Rawdon Potteries,

New World, and that they themselves have a rightful share in the marvels of invention, enterprise and progressive spirit which have been accomplished there. Certainly it is a poor rule that does not work both ways. If Americans are allowed "to read their title clear" to the storied abbeys, picturesque castles and literary monuments in England, they cannot object with reason if British engineers take pride in the costly works of New York and Chicago, the waterways of the Great Lake Basin, the utilisation of the power wasted at Niagara and Sault Ste. Marie, and all the other wonders of American and Canadian engineering science.

Sir William White, while not an orator, is a fluent speaker, with an engineer's trained talent for clearness of line, and a gift of his own for humorous comment and good-natured pleasantry. If his American and Canadian entertainers could have listened to his graceful acknowledgments of their hospitality and kindness they would have been well rewarded for the pains taken to enable the visiting engineers to see all the sights and to get an adequate idea of the stupendous energies of capital, municipalities, designers and inventors in working out the problems of a new world and the modern era of electric power. New Yorkers especially would have been highly gratified if they could have heard this running commentary upon the lantern slide illustrations of the subway, the great bridges over the East River, the tunnels under the North River, and the precautions taken to secure an abundant water supply for the American metropolis. All these great works he described with unrestrained enthusiasm, and as he counted their cost in millions he could hardly find words in which to express his wonderment over the faith of municipalities and the enterprise of Greater New York, where the genius of the engineers had overcome the obstacles of an unfavourable environment and enlarged the area available for a truly imperial centre of population. The sketches of the "sky-scrapers" were certainly less picturesque than Mr. Pennell's charming etchings at the New Gallery, and in some instances almost wantonly realistic; and while he gave an impressive account of the rapidity with which these mammoth structures were constructed, the enormous masses of capital invested in them, and the number of people earning a livelihood under a single roof—

10,000, for instance, in one of the largest Chicago buildings—he did not attempt to conceal his satisfaction that quaint time-worn London had remained behind the times. He was even more conservative in his description of the Brooklyn Navy Yard, for he was not prepared, as the director of construction for the Admiralty for a long period to admit that the old country had been surpassed in the resources of sea power; but his face lighted up with a fine glow of pleasurable reminiscence when he recalled his visit to West Point, the courtesies of General Mills and the beauty of the scenery on the Hudson.

There was no lack of enthusiasm when Sir William White recounted the marvels of Canadian progress, illustrated the enormous commerce of the Sault, described the new railways and waterways of the Dominion, paid glowing tribute to McGill University as one of the best equipped strongholds of modern learning, and displayed a fine series of pictures of Montreal, Ottawa, Quebec and Toronto. He explained how formidable a force Canadian energy had become when the improvement of the waterway north of the border was forcing the State of New York to undertake a new enlargement of the Erie Canal, and how winged a rapid flight among the sky-scrapers and storage elevators of Chicago, and finally swooped down upon St. Louis and the Exposition. Perhaps the most interesting passage of his address was his account of the new power generating works at Niagara, illustrated as it was with fine pictures on the screen, and containing an effective contrast between the first redskin who gazed with wonderment and awe at the majesty of the mighty cataract and the modern engineer who, while more sensitive to the scenic beauty of the flood in its onrush into the chasm, is chiefly concerned with the problem of wasted energy and the conversion of it into working power. The distance between the aboriginal and the electric engineer measured—in Sir William White's effective phrase—the entire sweep of the progress of civilisation. More eloquent than any purely literary phrase was the fraternal spirit in which this great designer of the British navy referred to everything that was progressive in the engineering work of Americans and Canadians. There was not a trace of what Emerson once described as the habit of condescension in the compliments and eulogies showered upon transatlantic engineers. Sir

William White had risen to the high level of Anglo-Saxon brotherhood, and with unaffected simplicity and sincerity could speak without envy or jealousy of the wonderful achievements in engineering in America and Canada, and from his own heritage in the glory and renown of the English-speaking world.

BEAUTIFUL OLDHAM SOCIETY.

The Beautiful Oldham Society is an organisation whose very name shows that it possesses courage and optimism in an unusual degree. It has been ridiculed as a Society which appears to people possessing only an average share of hope to have attempted an impossible task. But in spite of early ridicule, says the *Manchester Guardian*, it is beginning to command respect for the work which it has already done. If it is impossible to make such a town as Oldham beautiful absolutely, the Society has shown that much may be done to brighten some of its dull places. The encouragement of tree-planting was from the first one of the main objects of the Society. Experiments were made in the garden of the president (Mrs. C. E. Lees) to find out what trees and shrubs could best endure the smoky atmosphere. The results were then made known to the public. Permission has been obtained to plant several new streets with trees, and the Society has induced the Corporation to undertake work of a similar character. It is found that the black poplar thrives very well at the sides of streets. With a view to inducing the working-class people to utilise the small plots of soil which are found in front of many of the cottages, the Society on Saturday procured a number of rooted slips of privet and golden elder, which were offered for sale at reasonable terms. There was not what might be called a "rush" for these plants, but the business done was regarded as satisfactory, considering the experimental nature of the effort. It is probable that the Society will have such a sale annually and institute a "tree-planting day."

The desirability of implanting in the minds of children a love of such objects of natural beauty as can be produced in a manufacturing town is fully recognised. School gardens have been instituted at a number of the public elementary schools. They are kept in condition by the scholars, who

have manifested a great interest in this work. Every spring a show of flowering bulbs is held. The prizes are so arranged that the majority of them are within the reach of children and cottagers who have grown the bulbs they exhibit. Thousands of school children are admitted to the show free, and so inspired with a desire to rear these beautiful flowers in their own homes. Then the Society is always on the look-out for desolate spots of vacant land. When it has found one and obtained the permission of the owner, the ugly place is transformed by shrubs. The railway company has been induced to have one or two unsightly embankments treated by the Society, and a number of small plots have been taken hold of. Perhaps the most interesting part of this work is the attempt to brighten slum courts. One court was found with an insanitary ashpit in its centre. The sympathies of the landlord were enlisted, the ashpit was removed, and in its place a little garden was made. The care of the garden was handed over to the boys of the court. The boys have been equal to the confidence placed in them and are taking a great pride in their garden. The owners of a number of mills have been induced to plant trees round their mill lodges. The grounds in which some of the churches and chapels stand have been found to be the reverse of ornamental, and the Society has induced the authorities to give them a better appearance. In these and a hundred other ways the Society works incessantly.

There seem to be no limits to the scope of its work. One of its objects is to promote better housing for the poor. Its members have investigated one or two slum areas and exposed the black spots through the public Press. As a result of this action some improvements have been made to property of the worst class. One of the latest, and certainly not the least needed, activities of the Society has been the gathering and publication of information on the subject of black smoke and its prevention. The advice of experts has been obtained on the question. Quite an astonishing amount of valuable knowledge has already been gathered, and the inquiry is still proceeding. The Society is telling manufacturers what kinds of coal are best to burn in their furnaces, how it is best to burn them, and how they may detect the coal merchant when he sends a coal of a quality inferior to that which was ordered.

JAMES CARTLAND & SON, LIMITED.

MANUFACTURERS OF EVERY DESCRIPTION OF

Cabinet, Builders', Furnishing, & Naval Brass Foundry, BIRMINGHAM.

MACHINE-MADE BRASS SOCKET BOLTS.

Made in three widths and all lengths.

WITH SIDE ADJUSTMENT FOR HEAVY FANLIGHTS. BRASS, 1751 1/3 each IRON, 1752 1/4 each

Hinged at Bottom, Opening In. Brass 1751 5/6 Iron 1752 4/-

London Showrooms—57 HOLBORN VIADUCT, E.C.

may be obtained through Hardware Merchants, Factors, or Wholesale Ironmongers, through whom our New and Revised Catalogue of General Brassfoundry may also be obtained.

With a view to giving further assistance to mill managers and stokers it is proposed to have a case placed in the free library containing specimens of the kinds of coal most commonly used in mill furnaces.

If the Society has been ridiculed, it has also met with flattery in its sincerest form—imitation. Organisations with similar objects in view have been founded in several Lancashire and Yorkshire towns, and letters of inquiry and advice have been received from still more. The fame of the Society appears to have extended far, inquiries having come from places so remote as Newcastle.

INLAND WATERWAYS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on March 6, Mr. N. J. West, president, in the chair, a paper was read on "The Transport Possibilities of our Inland Navigable Waterways," by Mr. Benjamin H. Thwaite. The author commenced by observing that the creation of the inland located manufacturing industries of England and the development of our agricultural industry would have been impracticable but for the inland navigable waterways provided by our transformed rivers and canals, the inception of which he traced to King Henry I., and for the construction of which Parliamentary powers were obtained. Similar powers were obtained in increasing proportions up to 1793-4 when no fewer than thirty-eight Acts for the construction of navigable waterways or canals received royal sanction. He gave full credit to the important work of the Exeter Town Council in the construction of the Exeter canal. Generous recognition was also given to the work of the River Conservancy Boards initiated in the fifteenth century. To the work of the canal engineers, Brindley, Jessop, Telford, Vermuyden, Rennie and others, and the constructional efforts of the River Conservancy Boards, the author attributed England's possession of a magnificent system of water carriage by which the agricultural areas were connected with the manufacturing centres and the seaports, by which means the development of England's industries surpassed those of France and Spain. Even during the dark days of the Napoleonic wars, England was prosperous. Canal shares were highly valued,

but the work of Stephenson produced a rival that for many years led to the practical abandonment of public interest canals.

One of the effects of the railway boom in the forties during which no fewer than 272 Railway Acts were passed was to almost extinguish the interest of statesmen in canals, and Parliament by its indifference almost invited the policy of astute railway administrators in attempting to secure the control of the canals that were local traffic carriers and rivals. The author observed that as a result of that policy, the railway companies absorbed no fewer than fifty canals of more or less importance. The most serious feature of this was that it placed in the hands of the railway companies the power to determine canal rates for through traffic. The culminating effect of canal absorption, railway madness and Government indifference, was the depreciation of canal properties by many millions of pounds sterling, which, said the author, was equivalent to robbing the British people of the heritage of centuries of energy and enterprise in canal and navigable waterway construction.

The author went on to point out that modern statesmen and the public realised from the arguments advanced in favour of the Manchester Ship Canal in 1884-5 that the railway policy of obtaining canal control was entirely against the interests of the trading and industrial community, and, as a result, an Act of Parliament was passed in 1885 to check the canal control propensity. But the Act after a while was only an example of the *ex post facto* policy—it came too late. Some of the railway companies have altogether suppressed their canals, parts of which have been converted into railways. The Great Western Railway had relinquished its control over a group of canals, and under more sympathetic control the trade upon them was becoming prosperous.

A comparison was drawn by the author between the canal policies of the Governments of Germany, America and France, which was much to England's disadvantage. The waterways and railways of Germany were, he said, State-owned, and the Government was continually extending the lengths and carrying capacities of the canals. Owing as the German State did both systems, was a proof that canals were serviceable to the State, otherwise they would have been abandoned. But the author pointed out that

was to be appropriated to their further development, which the railway rates were stated to be 25 to 50 per cent. lower than those of British railway companies. The Government had used the State-owned canals and the charges for transport of the privately owned railways, and the canals were maintained in a high efficiency.

The author set forth the *prima facie* economic advantages of carriage compared with those of railway transport in other countries. Even in comparison with the lowest railway rates, canal transit costs were stated to be lower, and it was said that the advantage would be increased by the electrification of the canals. Various methods of canal haulage were compared to the advantage of the electrification of the railways. According to the author, our existing navigable canals possess immense potentialities of good for the benefit of our agricultural and staple industries. He urged the Government to compulsory purchase on the basis of the value of the profits, and he gave credit to the Chamber of Commerce for its action in attempting to improve local and national canal efficiency.

PAINTERS' MATERIALS.

On "The Specifying of Painters' Materials" was a paper by Mr. J. Cruickshank Smith, B.Sc., before the Royal Society of Architects. Invitations were sent to architects of building and house-painting. Mr. Arthur Smith resided.

Mr. Smith, according to the *Aberdeen Journal*, disclaimed any intention of criticising architects or painters in their methods of specifying materials. His aim was to direct attention to important points of view from which the subject of painters' materials should be regarded, which appeared to escape common attention, and to endeavour also to bring into harmony the apparently antagonistic positions of architect, painter, and paint manufacturer. Were the present methods of specifying paints and kindred materials calculated to protect the individual who ultimately paid the cost, viz. the architect? The standpoints from which the question of materials might be approached were (1) the manufacturing or scientific standpoint, and (2) the standpoint of

the craftsman painter. Usually architects and engineers who specified or used paints had neither the exact scientific knowledge of the manufacturer nor the practical experience of the painter. This was to a great extent inevitable when one bore in mind the enormous scope and complexity of the knowledge required of the architect of to-day. Still, there appeared to be a supine or neglectful attitude on the part of many towards paint questions, which perhaps accounted somewhat for the lack of proper wording in the framing of paint specifications—the phraseology of which appeared to have remained practically unaltered for two generations at least. Mr. Smith read extracts from a recent paper by a well-known decorator, Mr. J. D. Crace, in support of this view. Mr. Crace advocated the standardising of workmanship or quality of work, and Mr. Smith laid stress on the necessity of drawing a clear distinction between that part of the specification which related to materials and that part which related to workmanship. This question of standardising workmanship was one, he said, which related more particularly to the craftsman, and might well form the subject of discussion and action in the distinctively painters' associations. After reference to the extent of the evil of scamping and its relation to the system of competitive trading and "cutting," the lecturer passed on to discuss present-day conditions in relation to the ordinary materials of the painters' craft, and showed that linseed oil, white lead, priming, knotting, copal varnish, &c., were terms with a very elastic meaning. He discussed in detail extracts from actual specifications and schedules, pointing out cases where these documents, as commonly worded, did not protect the person on whose behalf the architect was employed. Standardisation was also required in regard to the materials of the paint trade. At present terms and trade names and descriptions were used in a vague way and matters were little less than elastic. The old-fashioned rules were (1) to purchase your goods from a respectable house, and (2) to pay a good price for them—good advice, no doubt, but hardly sufficient for modern requirements. Mr. Smith then alluded to attempts made by large buyers of paints, corporations and the like, to protect themselves by buying to specification, and he pointed out how such a plan might defeat its object unless followed with prudence and technical knowledge. protective paints, Mr. Smith gave some information. Recent researches in America, conducted by officials connected with some of the great railroads, had conclusively proved that, within certain limits, the chemical composition of the paint was not the prime factor that determined durability. It was the physical texture, or, to be more precise, the smallness in size of the particles, that was the essential point. Mr. Smith quoted details of actual experiments on this subject, and said that the practical result of the investigation was that durability and comparatively low cost were not incompatible. The lecturer went on to say that so far his arguments had been of the destructive order, and he might justly be asked what alterations he had to suggest on the wording which he condemned. He then discussed a number of points of interest to architects and painters alike, and indicated in what manner clauses dealing with various materials might be worded so as to meet modern conditions and protect those concerned against error or fraud. Concluding, Mr. Smith said the subject he had attempted to deal with was a very wide and complex one, and one that might be regarded from many points of view. He emphasised the growing need for the standardisation of paints, and more particularly the protective paints. He was pleased that interest in the subject had brought together such a large and representative audience, and he thanked them for their patient hearing.

The Chairman said he was sure he expressed the feelings of the audience when he said they had listened to a most interesting and instructive lecture.

Mr. Alexander Aitken, painter, said the lecture had been dealt with in a very comprehensive, lucid and racy manner. Regarding standardisation, he had always recognised the difficulty of the grading of specifications, and he thought that in Aberdeen they would be very happy to second any efforts in the direction of standardisation. He also referred to the prevailing competition, and said he should not be at all surprised if there were a reaction from this competition.

Mr. Williamson, president of the Master Painters' Association thought they were arriving at a time when the competition system should take a turn more in favour of the painter. Regarding Aberdeen, they were not far behind in specifying work, but he thought a great deal of fault lay with the workmen or at any rate with the master painter.

They were a great deal to blame for bad work. A thorough good tradesman would not do bad work, because he would look to his credit. It was really scandalous from an economic point of view that offers for a certain job should vary from 20s. to 120s. There must be something wrong both regards the material and the carrying out of the work.

Mr. William Kelly, architect, said that in his opinion the conclusion of the whole matter was that both for architects and for painters there should be something done in the way of education. He should like if in Aberdeen there were a technical college where architects and painters could go to know good material by examining it.

Mr. John Whyte, painter, remarked that he thought it was very necessary that proper inspection of work should be made by architects as the work proceeded. There should, he said, not a single architect in Aberdeen who gave no attention that was necessary to the inspection of painting, and that was the very first thing that would raise the price and help them to get on a right standard.

Mr. John Rust, city architect, said that in regard to the painter trade in Aberdeen, there was no doubt that the architects were in a very happy position. Mr. Whyte said that they did not look after the painterwork as they ought to do, but he might reply by saying that they had many good painters that the architects did not require to look after the work so carefully as they would otherwise have to do. He often thought that painters did not get enough money for the work they did, and he was satisfied that for about eight months of the year the painters' contracts were below cost price. He thought the painters should lay their heads together and try to get up a standard price, and if they got it up he was sure the architects would not want to crush them down. He thought they should raise their prices and not be so jealous of one another.

Councillor Latto proposed a vote of thanks to Mr. Smith for his lecture, and in the course of a few remarks pointed out that he thought the architects had a considerable amount of influence in the matter of contracts. When an architect saw an offer for a job at about half the price it should be, he thought it was the architect's duty to say to his customer that it was utterly impossible to buy the material at that price.

The vote was heartily awarded.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE

TO THE

ARCHITECTS & CIVIL ENGINEERS OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO.
becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

TENDERS, ETC.

* * * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

NEW CATALOGUES.

THE establishment of Merryweather & Sons can claim to have a history. It is only necessary to look at the representations of old types of their wind-engines, which appear in their latest catalogue, to realise that the evolution

of their windmill for domestic and other water supply was commenced a great many years ago, and that the improvements are their own creation. A more inexpensive power than is obtainable by their machinery cannot be devised. They have brought the experience gained during a long period to the perfecting of their windmills, which are examples of scientific construction. There are several varieties shown in the catalogue, but we advise those who are desirous of employing one of the pumping engines to enter into communication with the consulting department of the firm, where experts are to be found who are acquainted not only with Great Britain, but with many parts of the world. It would have been fortunate for the owners of several famous English mansions if they had adopted that course, for they would have preserved invaluable treasures.

THE Teale Fireplace Co. have issued new editions of their illustrated catalogues, which relate not only to the grate, which has proved its merits, but to various other apparatus.

THE Glasgow Corporation announce that the new wiring rules in connection with their electricity supply will come into force on May 1. The principal alteration in the new issue of the wiring rules is that dealing with the bonding and earthing of metal sheathed conductors and metal tubes and conduits. The Corporation now most distinctly insist that all metal tubes into which insulated electric light wires are pulled must be connected together by means of properly screwed sleeves or couplings, or securely soldered together so as to form a permanently continuous conductor from end to end of the system. Also, where iron pipes are used for protecting insulated electric conductors, it is necessary always to keep these iron pipes clear of gas pipes by means of a distance-piece, and special attention is drawn to the fact that this distance-piece is always fixed securely in position. There is a slight addition to the rule concerning the insulation of paper and jute-covered cables, and the undue use of flexible on installations is discouraged. Bare terminals on motors and accessories connected therewith are also prohibited, and these must be covered in some way.

BUILDING AND BUILDERS.

THE Runcorn education committee have resolved to build a two-storeyed school to accommodate 300 girls and 300 boys. Mr. James Wilding, surveyor to the Urban Council, has been appointed architect to prepare plans at a commission of 5 per cent. to include supervision.

THE Cardiff public works committee recently discussed the question of what local stone should be used in Cardiff side streets for surface dressing, &c., a sub-committee having visited a number of quarries. Considerable diversity of opinion existed. It was finally resolved that a list be formed of the various quarries from which stone can be bought, leaving to the discretion of the borough engineer the amount to be obtained from each quarry.

THE Battersea town hall estate, consisting of municipal workmen's dwellings, was inaugurated on the 11th inst. The houses are in the form of self-contained flats and give accommodation for thirty-six families. The erection was carried out by the works department of the Borough Council for 10,673*l*. The rents charged range from 6*s*. 6*d*. to 8*s*. 6*d*. per week. Each house is wired for electric light and includes a bath-room.

SCOTCH quarrymasters have decided to form an association, the objects being the benefit and protection of the slate trade generally. The quarries represented at the meeting last week in Glasgow were Ballachulish slate quarries, Easdale slate quarries, the Brecklet slate quarries, Balvicar slate quarries, Cullipool slate quarries, Breadalbane slate quarries, Belnahua slate quarries, Aberfoyle slate quarries, Craiglea slate quarries, Perth and Port Mary slate quarries.

THE foundation-stone laying ceremony of the Baptist church and schools, St. Andrew's Street, Rugby, was held on March 15. The block occupies one of the most prominent sites in the town, and is faced externally in red brick, the dressings being in Bath stone. A bold tower forms a prominent feature. The church will accommodate about 760 persons and the school over 800. The contract is let to Messrs. Linnell & Son, of Rugby, and amounts to £5,881 8*s*. 3*d*. The architects are Messrs. George Baines, F.R.I.B.A., & R. Palmer Baines, 5 Clement's Inn, Strand, London, W.C.

In future all repairs to barracks are to be carried out by the Royal Engineers instead of by contractors. Regimental workshops are to be opened, where sappers will form the staff, assisted by tradesmen from the infantry and ex-soldiers and reservists. In each command a surveyor's office will be established, and also an inspecting division, Royal Engineers. Each command will carry out its own repairs for estimates which individually are under 2,000*l*. The present division officers of the Royal Engineers and many of the civil assistants will cease to be employed.

THE seventh International Housing Congress will be held at Liège, Belgium, from August 7 to 10 next, in connection with the Universal and International Exhibition, under the presidency of the Director-general of the National Savings' Bank of Belgium. A special competition will take place in connection with the construction of workmen's dwellings—not in building materials. Twenty-five houses of different types are to be erected by building societies, industrial dwelling societies, &c., and these houses will be adopted as actual dwelling-houses after the exhibition has closed. The following subjects will be considered by the International Congress:—The action of national and local authorities in regard to the better housing of the working classes, and specially the housing of the poorest poor; the effect of local taxes and duties upon the rents of dwellings; the laws regarding sanitary inspection in various countries; the power of individual citizens to secure the better administration of the law; the better planning of all new housing areas—building on cleared sites, suburban developments, garden cities; consideration of the housing question in relation to public hygiene, public economy and social life; methods by which the more artistic designing of workmen's dwellings can be secured without a great increase in the cost; the value of workmen's gardens and allotments; legislation in various countries; the results obtained therefrom.

It is proposed to rebuild Steinway Hall and provide a new room designed to accommodate an audience numbering from 800 to 1,000 people, and containing a platform sufficiently large for a full orchestra.

AUSTIN'S NEW IMPERIAL PATENT SUPERFINE FLAX LINE

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country. N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

b VARIETIES.

H. R. H. PRINCE FERDINAND OF BULGARIA honoured Messrs. Winsor & Newton's establishment in Rathbone Place, Oxford Street, with a visit during his stay in England.

CHELSEA town hall is to be extended at a cost of about 18,000*l.*, according to the designs of Mr. Leonard Stokes.

THE cleaning and lighting committee of Edinburgh Town Council recommend that 1,950 of the present gas-lamps should be converted into incandescent gas-lamps during the incoming financial year.

THE cost of painting the fences, covered and open seats, &c., upon King's Road, Junction Road and Marine Parade, Brighton, is estimated, by the borough surveyor at about 425*l.*

THE Swansea Harbour Trustees contemplate issuing stock amounting to 500,000*l.* to meet the cost of carrying on the construction of the new dock. It is believed that the present state of the money market is favourable to such issue.

THE King's Norton Urban District Council will apply to the Local Government Board for sanction to borrow an additional 1,000*l.* for the purposes of baths at Selly Oak. This increases the total amount of the application from 12,000*l.* to 13,000*l.*

THE Canadian Government has decided to instal in the cities of Toronto and Montréal an improved pneumatic tube system for the transmission of mails. The tube to be employed will be 10 inches in diameter. The system employed by the American Pneumatic Service Co. will be introduced.

THE Liverpool City Council will apply to the Local Government Board for a loan of 26,000*l.* in connection with a scheme for the erection of public baths and washhouses in Speke Road, Garston. The baths committee will, however, be instructed not to expend more than 15,000*l.* on the proposed baths without the sanction of the Council.

TENDERS have been received from contractors for the extension of the waterworks at Port Ellen, Islay, but the committee have delayed acceptance pending the result of the report of Mr. Hogg, of Messrs. Crouch & Hogg, C.E., Glasgow, who has been appointed by the Local Government Board to report on the scheme.

THE Russian Government has ordered a project to be drawn up for the construction of a canal to connect the Volga with the Caspian Sea, and to be cut independently of the delta. The estimated cost of the work is 1,170,000*l.*, but its execution will depend on the result of the war in the Far East.

As a protection of the sea banks and cliffs at Tynemouth against erosion it is proposed to instruct the borough surveyor to prepare a general plan of a sea-wall, including a low-level promenade and carriage road from the North Pier to the south end of the Long Sands, together with approximate estimates of the cost in separate sections.

THE Great Western Railway Company are rendering a service to travellers by supplementing the lines of railway by motor-car services. In the summer the cars will pass through some of the most picturesque districts in the South of England. The carriages are of a superior kind, and the enterprise is one which is quite in the spirit of I. K. Brunel, who made the Great Western the most comfortable of all railway lines for travellers.

THE Dartford Town Council have raised a loan of 93,000*l.*, at 4½ per cent., for the construction of the tram ways. Messrs. A. J. White, Ltd., when they have completed their contract, will take a lease of the undertaking, tenable at the option of the Council at the end of five, ten, or fifteen years. Under the lease the Council is to receive a payment equivalent to the interest and annual repayment of capital, and 20 per cent. of the surplus profits.

THE waterworks committee of the Leeds Corporation on the 14th inst. reduced the fifty-eight candidates for the appointment of waterworks engineer to four, for which the salary offered is 1,000*l.* The names are:—Mr. E. F. McCullough, waterworks engineer, Belfast; Mr. C. J. Batley, waterworks engineer, Oldham; Mr. W. Ratcliffe Barnett, engineer in connection with the Thirlmere waterworks scheme, Manchester; and Mr. Charles G. Henzell, resident engineer at the Catcleugh reservoir, Newcastle-on-Tyne.

THE finance committee of the Burnley Corporation recommend a municipal rate of 5*s.* 10*d.* in the pound, the same as last year. The estimates show a prospective loss of 4,000*l.* on the tramways, but the tramways com-

mittee contend that with a reasonable charge for traction by the electricity committee the trams could be made to meet expenses and depreciation without any call upon the rates. The poor-rate will be increased 2d., so that the total rates will be 7s. 2d. in the pound, as compared with 7s. last year.

THE Chilean Congress have passed an Act authorising the construction of harbour works, at Valparaiso. The President of the Republic is empowered, for the term of two years, to enter into a contract for the construction of the works. Tenders are to be called for with at least one year's notice, and the cost is not to exceed 2,500,000/. The State may, however, put an end to the contract at any time by paying the still unpaid portion of the contract price with 10 per cent. added.

THE Eastern district committee of the Stirling County Council have approved of the plans and estimates for the reconstruction of the road bridge over the river Carron at Carron Ironworks. The plans showed a bridge 40 feet in width and 6 feet lower than the present bridge, the increased width being obtained by taking in the old waggon road immediately adjoining and connected with the bridge, and which the Carron Company had agreed to give free of charge. It was stated that the foundations of the present bridge could be utilised, and it was estimated that the cost of the reconstruction would be about 3,700/.

THE deepest mining shaft has been sunk to a little more than a mile in Cape Colony, and the deepest borehole has reached about the same depth in Silesia. It is said that there should be no insurmountable difficulties in carrying a shaft down twelve miles. An approximate estimate has shown that to reach a depth of two miles the cost would be 500,000/. Ten years would be required, and a rock temperature of 122 degs. Fahr. would be found; while to penetrate twelve miles would cost 5,000,000/. and would take eighty-five years, the rock temperature expected being 272 degs. Fahr.

THE Wolverhampton Board of Guardians were informed by the clerk at their last meeting that they had already borrowed from the Public Works Loan Commissioners 175,000/. for the new workhouse, but that body refused to lend them any more. The committee had negotiated with

the Ecclesiastical Commissioners, who required 3½ per cent. for a loan of 25,000/. The Board was 15,000/. overdrawn on the treasurer, and the architect had signed a certificate for a further 13,000/. due to the contractor for the new workhouse. It was decided to again approach the Ecclesiastical Commissioners with the view of obtaining their lowest rate of interest, as the matter is of serious importance to the ratepayers, the percentage asked for being in excess of other loans.

THE chief officer of the Glasgow Fire Brigade, in his report for 1904, estimates the total loss from fires within the city was 101,500/, which was less than half the estimated amount of the previous year. The malicious calls rung in from street fire-alarms showed the gratifying decrease of forty-five, the total recorded being thirty-three. In five cases street alarms failed to act, but the system had been well maintained and all faults promptly remedied. Fires due to defective building construction still bulked largely in the "causes" table, no fewer than 301, or 40.78 per cent., of the total within the city being due to this cause, thirteen only of these occurring in buildings erected since the passing of the Building Regulations Act, 1892. This percentage of fires caused by defective construction was the highest recorded during the past twenty years.

THE Borough Surveyor of Pontefract, in a letter to the Pulsometer Engineering Company respecting the breakdown at Roall Waterworks, says "the duplicate set of pumps both broke down within three days, causing what might have been a serious water famine in this district. Thanks, however, to the adaptability of the pulsometer, and the provision made by the Pulsometer Engineering Company, Limited, for meeting emergencies of the description, we were enabled—although the pumping station is five miles from a town—to have a complete temporary set of pumps at work in under fifty hours, thus averting a catastrophe. A larger pulsometer set was fixed a day or two later, and this efficiently maintained the water supply for over three weeks during the time the broken pumps were undergoing repairs."

THE housing of the working classes committee of the London County Council report that working-class dwellings, containing accommodation for 31,011 persons, have now been provided by the Council, and that in addition blocks

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS
COMBINING LENSES AND PRISMS.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

MAXIMUM LIGHT GLASS . . .

Is supplied in sheets for glazing like ordinary window glass.

Also in ornamental patterns glazed in lead.
And in crystal tiles framed in copper.

of dwellings capable of accommodating 912 persons are almost ready for occupation. The gross rental receivable from the dwellings amounts approximately to 118,000*l.* per annum. The income from all the dwellings has hitherto been sufficient to meet all outgoings after making full provision for repairs and renewals, charging interest on capital outlay, and setting aside a sinking fund sufficient to replace the whole of the capital outlay within a period of sixty years. During the year ended March 1904 the interest and sinking fund charges amounted to 46,832*l.* The accumulation in the sinking fund amounted at the same date to 45,225*l.*, while a sum of 18,095*l.* stood to the credit of the repairs and renewals account, after paying for all repairs required up to date. All these charges have been met out of revenue from the dwellings.

A BILL to provide for the establishment of wages boards has been presented by Sir Charles Dilke, and supported by Messrs. Bell, John Burns, M'Kenna, Tennant and Trevelyan. The object of the measure is to provide for the establishment of wages boards, with power to fix a minimum rate of wages to be paid to workers in particular trades. It is left to the Home Secretary to say for what trades wages boards are to be appointed, so that, at all events in the first instance, wages boards need be appointed only for what are known as the "sweated industries," that is, industries in which outworkers are largely employed, and in which the rate of remuneration is low. A wages board will have power, if they think fit, to fix a minimum rate for any single kind of work or for any single class of workers in a particular trade. They will have the widest discretion as to fixing a time rate or a piecework rate, and as to varying the minimum according to the kind of work and class of persons employed. The Bill provides that a wages board shall be composed of representatives of employers and representatives of employed in equal numbers, with a chairman chosen by the members or nominated by the Home Secretary. It is proposed to entrust the enforcement of the payment of the minimum rate to factory inspectors.

The expenditure of 5,295*l.* on extensions at the municipal electrical works, Shrewsbury, has been sanctioned.

ELECTRIC NOTES.

An English syndicate has secured control of the Montreal Light and Power Company, which has a practical monopoly of the electrical power supply of Montreal, by the purchase of 20,000 shares of the Corporation stock, which gives them a majority holding.

THE Board of Trade have adopted the recommendations of their inspector, Colonel Von Donop, on the question of the distances at which the tramcars should be apart when running in Manchester. The cars in the central parts of the city may approach each other very closely. In the outer districts a distance of 25 yards is to be maintained.

THE ratepayers of Torquay have by a public poll expressed disapproval of the raising of a loan by the Town Council amounting to 42,000*l.* for a new electric-lighting and power station. A Local Government Board inquiry into the application took place some weeks ago. There were 5,069 votes against the project and 416 in favour of it.

THE Sheffield Corporation Electric Supply Department have fixed a new high candle-power arc lamp as a trial at the corner of Surrey Street and Pinstone Street, in front of the town hall. This lamp consumes only the same energy as the other lamps round the town hall, but in comparison gives a brilliant light. The same class of lamp is used round the Mansion House in London with great success.

THE Ormskirk Urban Council have adopted an electric-lighting scheme for the town at a cost of about 20,000*l.*, which sum, however, includes the provision of a refuse destructor to be worked in conjunction with the scheme. The Council have entered into a provisional agreement with the London Electrical Construction Company to carry out the works.

THE electricity committee of Glasgow Corporation recommend the appointment of Mr. W. W. Lackie, chief assistant, to succeed Mr. W. A. Chamen as chief engineer and manager of the electricity department at a salary of 800*l.*, to rise to 1,000*l.* It has also been agreed to recommend that Mr. Archibald Page, superintendent of the generating stations and sub-stations of the electricity department, be appointed chief assistant, in succession to Mr. Lackie, at a salary of 500*l.*

FIRE STAIRS

On MERRYWEATHERS' IMPROVED PRINCIPLE.

Experienced Engineers sent to any part to inspect Buildings and give Estimates for Fire Escape Stairs to comply with Local Authorities' requirements.

Merryweather & Sons construct and fix every description of Fire Escape Stairs, Balconies, Gangways, &c.

ALL WORK CARRIED OUT WITH
UTMOST DESPATCH.

MERRYWEATHER & SONS

Fire Escape Staircase Erectors,
63 LONG ACRE, W.C.

Works, GREENWICH, S.E., LONDON.
ESTABLISHED OVER 200 YEARS.

The lighting of many of the streets of Dalkeith by electricity was inaugurated on the 11th inst. The private lighting was turned on twelve months ago. The installation of the Electric Supply Corporation consists of twenty-seven 10-ampere arc lamps, which are arranged in three circuits of nine lamps. The lamps are each of 1,000 candle-power, and are hung from columns of graceful design some 24 feet high.

The Metropolitan Asylums Board desire to obtain the consent of the Local Government Board to the inviting of tenders for the installation of proposed systems of electric lighting, telephones and fire-alarms at the Southern hospital from nine selected firms, and to their entering into a contract or contracts for the execution of the necessary works without, in the first instance, advertising for sealed tenders. The cost is expected to be about 9,000l.

The Louth Town Council have rejected a scheme prepared by Messrs. Handcock & Dykes, consulting engineers, for the installation of electricity within the borough. The total cost approximately was 13,010l., and oil had been decided on as the generating power; 2,430l. was put down for oil-engines and dynamos; 4,980l. for switches, switch-board, accumulators and other accessories; 4,000l. for mains and feeders; 1,000l. for public lighting; 800l. for services; 1,100l. fees and expenses; foundations and silencing pit, 130l.; and buildings, from 800l. to 1,000l.

At the meeting of the Aberdeen Town Council on the 7th inst., allusion was made to the fact that their electrical engineer was engaged to advise the Dunfermline Corporation regarding their proposed electric power order. Subsequently a member gave notice of motion to the effect that no Corporation official be allowed to engage officially in any work other than that connected with the Corporation unless with the consent of the Town Council; and, further, should any fee be charged for such work, the same to be fixed by the committee under which the official is employed.

"The Administrative County of London and District Electric Power Company Bill" has been referred for examination to a select committee of the House of Lords, consisting of the Earl of Camperdown (chairman), the Earl of Lytton, Lord Zouche, Lord Aberdare and Lord Estcourt. The committee will also have under consideration the East

London and Lower Thames Electric Power Bill, the Charing Cross and Strand Electric Supply Corporation Bill, the City of London Electric Lighting Company Bill, the Metropolitan Electric Supply Company (Acton District) Bill, the Metropolitan Electric Supply Company (Various Powers) Bill, the North Metropolitan Electric Power Supply Bill, the Central Electric Supply Bill and the County of London Electric Supply Company Bill.

AN ARCHITECT'S TINDER-BOXES.

In an article on "Portable Fire" the *Birmingham Daily Post* says:—Our fellow-townsmen, Mr. Jethro A. Cossins, has a very fine collection of tinder-boxes, which was exhibited at the last conversazione at the Birmingham and Midland Institute, and attracted much attention. They comprised with very few exceptions a specimen of every kind known, although there are, as may be supposed, many varieties of pattern and detail. Some description of a few of the specimens may not be without interest.

A form that was once very common, but is now rarely seen, is a simple wooden box, 7 or 8 inches long and 4 or 5 inches wide, divided into two unequal parts, whilst the somewhat more expensive and portable box was made of sheet iron or tin. It was circular in form, about 4 inches in diameter and 2 inches deep. On the lid was a socket to hold a candle, and within a circular disc of tin to act as a damper and protector of the tinder. When not in use the flint and steel were preserved within the box. The tinder was made by charring a piece of linen rag until it became black and tender. The rag was held between a pair of tongs and set alight, and when sufficiently burnt was dropped into the box and extinguished by means of the damper. The steel was generally about 3½ inches long and 2¼ inches wide, shaped something like the capital letter "U" reversed. Almost any chipping of good black flint served to strike with, but to be conveniently held it should be about 2¼ inches long and have one edge rather thin. The sparks are tiny shavings of red-hot iron, which when dropped on the tinder immediately ignited it. On dexterously applying the point of a thin

sulphur match a flame is quickly and easily produced and can be at once transferred to the candle. The popular notion that to get a candle lighted by means of the flint and steel was a long and tedious process, generally resulting in barking the knuckles, is altogether erroneous. If the appliances are good and the tinder dry, it requires but little dexterity to get a flame in less than half a minute, as Mr. Cossins himself demonstrates. He, in fact, can secure a light almost as expeditiously as with a lucifer match. The forms referred to were those in use in farmhouses and cottages; but many of the tinder-boxes in the collection are made of brass, and some of them are beautifully embossed and ornamented.

Tinder-boxes for the pocket were also in demand. The favourite pattern was a strong, oval iron box, sometimes japanned and ornamented, bearing a resemblance to a common form of tobacco-box carried even now instead of a pouch. In some of these pocket tinder-boxes the lid was entirely removable, and the steel was rivetted to the inside, whilst others were hinged at the side, the steel lying loose inside with the flint and tinder. Another and even simpler form appears to have been not uncommon. This was a brass cylinder about an inch in diameter and three inches long, with a cover at one end and a sliding bottom at the other. The lid and sliding bottom were connected by a light brass chain which hung loosely. When the box was to be used the sliding bottom was forced up the cylinder by the finger until the plug of tinder appeared near the open end at the top. Sparks were then struck in the usual way, and when the light had been secured the sliding bottom was drawn back down the cylinder, the piece of flint placed inside and the lid put back into position. It is highly probable that in these pocket instruments the tinder used was a kind of tree fungus that had been steeped in a strong solution of saltpetre.

There are several examples that bear a striking resemblance to a pistol, a shape that may have had its origin from a very simple cause. It is said that in the days of the flint and steel muskets soldiers used the locks of their weapons for obtaining a light. A piece of tinder was placed in the pan, and the lock was then snapped. This would be a quick and ready means of securing the light, and what more natural than that it should suggest the

pistol-shaped tinder-box? The commonest kind of pistol tinder-boxes look like a pistol without a barrel. They are fitted with forked props to make them stand level, and have a socket for a candle screwed into the side. A little receptacle in the side of the stock serves to contain matches, and is closed by a lid with a hasp. A more expensive kind is of brass, with a short barrel like a pistol in which the matches were kept. Some small and highly-finished pistol tinder-boxes were also made for the pocket. Mr. Cossins has one of Japanese manufacture. It is beautifully chased and is fitted with a small spring lock, flint and steel, a piece of exquisitely-adjusted mechanism.

Tinder-boxes were in general use until about 1835, but were then supplanted by more expeditious and portable methods of securing a light. The writer remembers the first matches longer and wider than those now used, tipped with a chemical preparation covering about half an inch. They were ignited by drawing them quickly between a folded piece of chemically-dressed cardboard, hinged in the middle and closed on the match. The operation was frequently unsuccessful. If the card were pinched too tightly by the forefinger and thumb of the left hand whilst the match was withdrawn by the right it broke into two pieces. If the card were too loosely held the chemicals did not act. Then came matches more nearly resembling those now used, but when they were struck they made a considerable report. They were called Congreve matches, after the inventor of the rockets so much used at that time, and since, in British warfare. The clever manipulator of the flint and steel doubtless clung to them for a time, but ultimately the old tinder-box had to give way before the handy little match now so cheap and so perfect.

ASSOCIATION OF TEACHERS IN TECHNICAL INSTITUTES' BUILDING SECTION.

THE first ordinary meeting of the above section was held on Saturday, March 11, at the Marlborough Room at the Regent Street Polytechnic. Mr. Hugh Davies, head of the architectural and building trades' department, Northern Polytechnic, was in the chair.

A paper entitled "The Training of a Craftsman" was

ROBERT W. BLACKWELL

AND CO. LTD.

59 CITY ROAD, LONDON, E.C.

COVERED WITH RUBEROID ROOFING.

read by Mr. E. L. Bates, of the London County Council School of Building, Brixton, S.W.

The paper reviewed the past training of the craftsman as set forth in the charters of several of the City companies, emphasised the entire lack of any systematic training at the present time, the difficulties of teachers and students under present conditions, and made valuable suggestions for the efficient training of future craftsmen. After remarks and criticisms by the Chairman, Secretary, Mr. Evans (South-Western Polytechnic), Mr. Purcher (Wandsworth), Mr. Firth (Tottenham), and Mr. Fitzgerald (Paddington), it was felt by all present that the subject was one of national and vital importance, and that it was not possible to adequately discuss the excellent paper in an impromptu manner. It was decided on the suggestion of Mr. Hobart Pritchard, of the Regent Street Polytechnic, to adjourn the discussion to the next meeting of the section on April 1, and that in the meantime the paper be printed and circulated in order that members might give the matter careful consideration.

The meeting was of the opinion that some practical scheme would be evolved as the result of the discussion, and which, taking into account the personnel of the section, would be a valuable contribution towards the solution of a very difficult problem. A vote of sympathy with Mr. C. F. Mitchell, head of the technical school, Regent Street Polytechnic, in his present serious illness, was passed unanimously.

NATAL ARCHITECTS' INSTITUTE.

THE annual meeting of the Natal Institute was presided over by Mr. Cathcart W. Methven, who delivered the following address:—

Colleagues and gentlemen,—Before moving the adoption of the report and balance-sheet which we have just heard, I would beg to submit a few remarks upon the more important events of the past year, my first as President of the Natal Institute of Architects. First of all, I would most heartily thank my colleagues for the honour done to me in electing me President of the Institute, an honour which I appreciate all the more, coming as it does from my brother architects. It was, however, with many misgivings that I entered upon the duties, following as I did a

man of such exceptional popularity and of so many good points as our late respected chief, William Emery Roberts. His works in Durban are so well known and numerous that it can with truth be said of him, "Si monumentum requiris circumspice." To him is due the honour of founding the Institute, and of getting it incorporated by Act of Parliament. It is therefore with all the more satisfaction that we are able to report a certain amount of work done by the Institute which we know, from his expressed views on the subject, to be exactly on the lines he would have adopted. It is some gratification to have secured the excellent portrait of our late President which you see hanging on the wall. The thanks of the Institute are due to the hon. secretary, Mr. Ritchie, the donor of the handsome and appropriate gift.

I regret to have to record the death, under circumstances so tragic as to be unparalleled in the history of the colony, of Frank M. Kent, of Maritzburg, one of the foundation members of the Institute. An able and talented architect and an exceptionally clever draughtsman, he has left throughout the colony many examples of his skill. In Durban his best known works are the Girls' Model School, Gale Street, won in competition, and the Brewery Buildings in West Street.

A subject which has demanded considerable time and trouble from your sub-committee appointed for the purpose has been the preparation of a model set of conditions of contract between building owner and builder. This has been done largely in conjunction with a sub-committee from the Master Builders' Association and is now completed, and we hope to the satisfaction of everyone. Hitherto the conditions of contract in use have been so many and so varied as to be quite perplexing. The desirability, therefore, of having a uniform set of conditions to be used by all the members of our Institute can hardly be over-estimated, alike to building owners, architects and builders.

The classes for building construction and mathematics, conducted by Mr. Cunningham in the Boys' Government School, Durban, under the patronage of the Institute, seem to be meeting a long-felt want and to be making good progress. Last session the pupils were examined by the Council, and book prizes and certificates were awarded

by the Institute to the best pupils. At the prize-giving, Mr. Delaney, Government inspector of schools for the coast district, took the opportunity of publicly thanking the Institute for its help in assessing the work of the students in subjects of which none of the Government officials had sufficient knowledge to enable them to do so. While on the subject of technical education I would mention that your President was requested to appear before the Government Commission on technical education and state his views on the subject. This I did, when I put before the Commission what, in my opinion, should be done in the matter by Government for a town of the size of Durban.

During the past year the Institute has been increasingly recognised by building owners, builders and legal practitioners, requesting me, as your President, to act as arbitrator, assessor and valuator, and to give expert evidence in the courts of law. While this class of work is largely non-remunerative owing to the amount of time involved, I have attempted to do my best to give satisfaction, in order to encourage what doubtless is intended as a compliment to your Institute.

At last we have made a definite start with what, to my mind, is the most important matter of all affecting the interests of our profession. I allude to the registration or statutory qualification of architects, a subject upon which our late President had very decided opinions. Many people are ignorant of the fact, and when informed of it are quite incredulous, that any person whatsoever can by paying 5*l.* per annum obtain a Government license to practise as an architect and "no questions asked." Such, however, is the melancholy fact—a fact, alas! too painfully demonstrated by some of the buildings which disfigure the streets of our towns. While doctors, lawyers, dentists, chemists and conveyancers are all protected by Government, the poor architect is exposed to the competition of a host of charlatans who usurp his title, filch his commissions and bring discredit on his craft. In most other countries than ours the public and the profession are protected from unqualified and unprincipled practitioners. Then why not here? The building operations of any community affect not only its financial interests, but also its physical well-being, aye, even in cases, its very life. Surely the public have a right to demand that those to whom the supervision

of these building operations is entrusted are properly trained and qualified to undertake them. There are, it is true, a few architects who are not in favour of registration. They say that an architect is an artist, and that one cannot examine or test art, but surely while maintaining the highest ideals it must be possible to exclude those who under reasonable tests show that they altogether lack either any aptitude for architecture or adequate training. In Germany and America the universities grant degrees in architecture, artistic knowledge and design, as well as in the science of building construction. This fact supports the contention that artistic acquirements can be tested by a qualifying not a competitive examination. Then, again, others object and say that registration would have the effect (since all existing practising architects would have to be put on the register) of stamping with the seal of official approval the lowest ranks of practising so-called architects. True, but every year that qualification is postponed the situation gets worse and worse, for the immediate effect of a Registration Act would be to put a stop to any further increase in the number of incompetents, and thenceforward they would naturally be a gradually diminishing quantity. Of course, it is principally the younger generation of architects which would benefit, and, as I told the Government Commission, technical education would then be not only desirable but an absolute necessity. A sub-committee of five has been formed to push this matter ahead, and bring it before Government. We confidently look for the support of not only all the members of the Institute, but also of the public, and so help to give our profession a recognised status, and raise the standard of architectural education and training throughout the colony.

We meet this year under the cloud of severe commercial depression, which, of course, brings building practically to a standstill. As old commissions get completed, and very few new ones are forthcoming to take their place, we are face to face with a situation which has been unparalleled in Durban for the past fifteen years. We are told that trade will soon revive, but I fear that there is a lot of leeway to make up. Trade will have to revive considerably before even the buildings that are completed are all occupied, let alone building any new ones. Two important municipal buildings have been practically completed, viz: the Central

Fire Station (Ing & Anderson) and Telephone Exchange (Stott & Kirkby), both won in competition, assessed by our late President. A great many business premises have been completed during the year under review, and there are still more approaching completion. Many of these show a distinct advance in the character of the building to what we have been hitherto accustomed in Durban, by the more or less liberal use of granite, stone, terra-cotta, tiles and fire-resisting construction. Many of the new buildings are distinct ornaments to the town, but, alas! how many are not. While we know that the municipal authorities do a little towards trying to preserve the architectural amenities of our principal thoroughfares, it is thought by many that they could and ought to do more, and defend us from some of the hideous sights which force themselves upon us. Happily the building public seem to be slowly awakening to the fact that good architecture has a commercial value of its own; for they can hardly fail to note that where a building is well planned and artistically treated, it is more eagerly sought after and its value correspondingly enhanced.

Before closing this already too lengthy epistle, I would urge you to try and use more frequently the comfortable premises which we now possess in Hermitage Street. All the best professional papers are to be found there for perusal as opportunity offers, and it has also been suggested that, say, monthly meetings should be held (at any rate, during the winter months), when papers could be read and discussed to our mutual edification. Throughout the year your Council have always been ready with their valuable advice, and supported me with unswerving loyalty. I desire to record my heartiest thanks to them.

FAILURES OF CONSTRUCTION.*

In presenting to you the problem of this evening's talk I shall not try to touch upon every point in which construction may be said to have failed, and the point of view

* A paper by Mr. F. Elliot Cabot, assistant secretary of the Boston Board of Fire Underwriters, read before the Boston Society of Architects, and published in the *American Architect*.

is perhaps more correctly described as that of the insurance engineer than that of the underwriter. I should have chosen the term "insurance engineer" rather than "underwriter" were it not for the fact that the insurance engineer as a factor in our improved knowledge of construction is comparatively new, and that to most people the term fire-underwriter expresses more definitely the idea I am here to represent.

Of the types of construction which have been most prominent of late in the minds of the public there are two which probably are to-day better known than others. These are "mill" construction—so-called because it was supposed at least to be patterned on the standard of the best types of construction for manufacturing plants—and the so-called "fireproof" construction.

Both of these types have been presented to the public as panaceas for the enormous fire-loss of this country (a destruction of property which is as truly a loss as if the money value represented by it had been thrown into the sea), and both of them have, in some forms of their development, failed entirely to prevent this loss.

The reasons for these failures are matters of careful study by active-minded men, trained for the purpose, and once understood will be as surely overcome as other engineering problems have been.

In the case of the so-called "mill" construction the error seems to have been twofold: first, in the application of this construction to work for which it was not intended; and secondly, in a failure to carry out fully and properly the principles upon which this form of construction was based.

This type of building was originally designed to cover in and protect from the weather large manufacturing establishments in which strength and not beauty was the leading requisite. It was designed to remedy certain defects which had appeared in the earlier type of building used for manufacturing purposes, such as concealed hollows in walls and floors, unduly combustible roofs and passages for fire, but not for firemen, from one part of the building to another, and it did overcome such difficulties to a very reasonable extent. It also improved the lighting, heating and ventilation of buildings for such work, and, in combination with the probable contents and the very

cellent fire-fighting apparatus which was provided, succeeded largely in furnishing a satisfactory substitute (for mill building) for the "combustible architecture" which had preceded it. It must, however, be kept in mind that compared to the city building to be used for the "storage and sale of merchandise" the mill, even the cotton-mill, contains but little combustible contents, and that the mill, though often containing large unbroken floor-areas, is of comparatively slight height.

When, therefore, the success of this construction (which was really the first work of the insurance engineer) in reducing the fire-loss in mills brought it to public notice, and the attempt was made to adapt it for use in stores and warehouses, no adequate provision was made for the changed conditions. The requirements of trade called for offices and counting-rooms; they were partitioned off with hard-pine sheathing. The shape and size of city lots made difficult to put the stairways and elevator-shafts in separate brick towers, as they are in the best built mills, so the stairways and elevators were put inside the main walls of the building, and were left unenclosed or only partially cut off. The desire to have attractive salesrooms led to the use of varnish in place of plain wood, or, better still, well whitewashed surfaces. The necessary crowding together of buildings in cities makes thorough protection of outside openings most important. But shutters interfere with light, and require attention which, without mill discipline, was not easily secured, so shutters were neglected or often omitted.

The use of such buildings to house several tenants under one roof made the mill discipline impossible and increased materially the danger of fire from rubbish, from careless use of matches, from many other well-known causes. The lack of skilled mechanics as a part of the working force of such a building was no doubt a reason that proper fire-fighting facilities, as a part of the equipment of the building, were not more commonly provided. In short, there was an attempt to use "mill" construction for warehouses and stores without keeping in mind its essential features, which briefly are:—No "vertical openings," no "concealed spaces," the minimum of "combustible finish," with ample facilities for extinguishing fire at its discovery, and ample protection from outside exposure. Under these circum-

stances it is not surprising that "mill" construction did not for city warehouses fulfil all expectations. Yet I do not feel that the construction was to blame but the use made of it. Railroad semaphores are a necessary part of railroad equipment, and especially so in these days of fast trains, yet I once heard a first-class engine-driver say that "they got in the way like thunder when you wanted to make time," and I fear that this is the feeling of many merchants and owners of buildings as to the essentials of mill construction.

In the case of "fireproof" construction difficulty seems to have come from a different cause. As in many other matters the American tendency to go to extremes has resulted in undertaking the construction of enormous buildings, limited only by the strength of materials as to height and by the ground available as to area. In constructing such vast buildings it has been assumed that because a material would not under ordinary conditions burn it was therefore "fireproof," or at least reasonably "fire-resisting." The enormous expense required by such construction has led to economies which have proved dangerous and to methods which fire has tried and found wanting. No one who saw the United States Government Warehouse, at Baltimore, soon after the awful conflagration of last year, can have any doubt that it is possible to build a warehouse of reasonable size which would, even under the terrible strain of such a fire as that, be a protection to the merchandise within its walls. If it had not been for the alteration in its original form made necessary by the introduction of a modern elevator, I doubt whether the expense of repairing that building would have been more than the cost of glass for the windows and a little paint and putty.

It may be said that this building was not exposed to the extreme test of those awful hours. Yet buildings all round it were totally wrecked, and it stands to-day in practically its original form, except in the substitution of brick for granite for its interior columns.

And this leads me to a digression from the main thread of my argument. For thirty years every engineer, every architect, every builder of repute has known that stone, especially granite and marble, while not in themselves combustible, are destroyed by fire almost as readily as

wood. If anyone had doubted it before last winter, the Baltimore fire proved it beyond any doubt. Yet I venture to say that there is not to-day a large city in this country in which there will not be during the year 1905 a large amount of marble or granite used in fireproof buildings, and in parts of such buildings so high above the street that the use of water to protect them from fire will be, so far as fire-departments are concerned, physically impossible.

Is it possible that the American brain, so fertile in every other direction, is unable to cope with the problem of designing and erecting an attractive and suitable exterior for a building which is designed to resist fire?

And now let us return for a moment to the false economies which so often confront the underwriter who, from the business point of view, is endeavouring to fix a proper price for the indemnity which he has for sale.

One of the commoner forms is the slighting or the deliberate reduction of the protection for the steel framing which is the skeleton of all these great buildings. The records of the cost of construction of some of the larger office-buildings destroyed in the Baltimore fire show that the marble wainscoting and flooring of the halls in these buildings cost more than the protection of the steel frames, and we know that in one building, at least, a form of floor construction which was proved to be satisfactory was given up and a cheaper and, as it proved, entirely unreliable form substituted at a saving of 1 or 2 per cent. of the cost of the building.

Surely such work as this is not worthy of respect, and is not and cannot be remunerative in the long run.

We are asking these steel frames to carry enormous loads, to withstand great strains, and yet we grudge them the slight additional cost of a reasonable protection against fire, not only against a conflagration, but against such fires as have and will occur within the building or its immediate neighbours, and we spend twice the money which the proper protection would cost on decoration which may or may not be good art.

Again, it is a common practice to set interior partitions on top of combustible wooden floors, even when the partitions are made wholly of incombustible material, and as a result a slight damage to the wooden floor wrecks twice its value in partitions and their finish.

We use iron face-plates on the fronts of these buildings and let the adjoining brickwork rest upon them so that a slight expansion of the iron displaces many feet of brick facing. Does it pay? Is it good work? Does the result justify it? Surely not.

In the fireproof building, too, we seem to depart from the construction which is justifiable for such work by the great expanse of unprotected windows.

Of course, light and air are most desirable, but from the underwriter's point of view it is fair to expect protection from more than the weather in the best type of building.

Vertical openings, too, have been quite a factor in the destruction of several buildings of this type, especially in those of a great height, as they almost invariably act as a flue to draw the fire from one storey to another. If a large office-building is to be regarded simply as a stove which will from time to time be burnt out, it is perhaps sufficient to provide for protection to the building itself, but if it is to provide protection for its contents then the vertical openings and the exposed windows need protection.

I have tried briefly to state why these forms of construction have not been as successful as they ought to have been, and I will endeavour briefly to give the insurance-engineer's hope of what may be done to overcome these difficulties.

Considering first the "mill" form of construction, I believe the automatic sprinkler, the fire-door and the fire-shutter, with a restricted use of combustible finish, will solve most if not all of our difficulties in this direction. I wish architects and engineers would make themselves more familiar with the use of sprinklers, because so much may be done in the construction of the building to make sprinklers thoroughly effective. A smooth ceiling or one with panels approximately 10 feet by 10 feet or 5 feet by 10 feet will give sprinklers the best chance to distribute the water to the best advantage.

For the "fireproof" building I must, at the risk of being called a crank, urge the use of "wire-glass" in metal frames, both for exterior use and where it is necessary to light stair and elevator wells.

Cut off the vertical openings, protect the steel frames everywhere and protect exposed windows, then "fireproof" buildings will come nearer to deserving their name.

JENNINGS' PATENT

DUPLEX BATH VALVES

(For Hot and Cold Water Supply), and
HALF-TURN LEVER WASTE.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE

TO THE

ARCHITECTS & CIVIL ENGINEERS OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO.
becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

MAY-OATWAY FIRE ALARM.

Don't be burnt out. Compare the losses below, in buildings with and without May-Oatway protection.

WITH MAY-OATWAY AUTOMATIC SYSTEM.			
J. Thomasson & Sons, Bolton	...	Loss	£48.
(Acted ten minutes before sprinkler)	...		
Oleington Spinning Co., Dundee	...	No claim.	
H. Jenkinson, Leeds	...	Loss	£10.
Do. do.	...	Loss	£60.
J. Ireland & Sons, Dundee	...	Loss	£25.
Name withheld by request, Glasgow	...	No claim.	
(Signalled and fire put out; sprinkler did not act)	...		
Shaw, Walker & Co., Glasgow	...	Loss	£225.
Aberdeen University Press	...	No claim.	
Olark & Co. (Ltd.), Anchor Mills	...	Under	£50.
S. Henderson & Sons, Ltd., Edinburgh	...	Under	£50.
WITHOUT MAY-OATWAY ALARM.			
Sir Chas. Tennant, The Glen	...	Loss	£100,000.
Long Acre Motors, &c.	...	Loss	£250,000.

MAY-OATWAY AUTOMATIC FIRE ALARM protects more property by millions of pounds than all similar systems in U.K. put together. It pays to follow great leaders. This invention, used by J. & P. Coats, Ltd., A. Guinness, Sons & Co., Cadbury Bros., Rowntree & Co., H. Tate & Son, Brown & Polson, Harrod's Stores, Midland Railway, and hundreds of others, is equally necessary to you.

MAXIMUM loss from fire originating in any building fitted with MAY-OATWAY SYSTEM is less than 3d. in the £ of the value at stake.

Send for particulars.
No. 94 Paul Street, E.C.; Glasgow, Manchester, and Liverpool.

WOODLEIGH.—March 25.—For the erection of a farmhouse at Woodleigh, Devon. Mr. Alfred Steere, architect, Aveton Gifford.

FIRE PROTECTION.

WHAT might have been a very serious fire occurred early on Tuesday morning at the premises of Messrs. W. & C. Pantin, wholesale provision merchants, Upper Thames Street, London, E.C. The fire apparently originated in the basement, near the bottom of the lift, which runs throughout the entire height of the building. Strange to say, the place of the origin of the fire was preserved almost intact, a very fortunate thing, as the floors above were heavily stacked with cases of provisions. The upper portions were very considerably damaged and the lift-well entirely destroyed. On looking round the basement we found that this was lined throughout with Uralite, the new fireproof material, and there is no doubt that if the ground floor had caught the whole place would have been gutted.

THE Mersey Docks and Harbour Board have approved of a recommendation for the construction of a new dock on the site of the Victoria Wharf, Birkenhead. The original plans have been modified. The new dock would be 1,450 feet long, 300 feet wide, with an entrance of about 100 feet, and it would accommodate five or six modern East India ships.

MAY-OATWAY FIRE ALARM.

WHAT USERS SAY.

Messrs. J. Thomasson & Sons, Spinners, of Bolton write:—“A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily, 10 minutes before the Automatic Sprinkler went off.” Loss £45. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works Edinburgh, write:—“A fire broke out in our factory during the dinner hour on January 13, 1905, when the May-Oatway installation (put in since our previous fire saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well.” Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.O., Premier, writes:—“This system has been largely adopted in New Zealand, and has given the greatest satisfaction.” (The Government are the largest users protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—“Fire March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss.” Claims paid, £10 and £80 respectively. What have you done to limit your loss?

ELECTRIC NOTES.

The Barnsley municipal electricity works will be enlarged at a cost of about 4,500*l*.

The Clonmel asylum is to be lighted by electricity according to the scheme prepared by Mr. Lawless, Dublin.

MESSRS. BRUCE PEEBLES & Co., LTD., Edinburgh, have received the contract from the Lancashire Electric Power Company for the supply of large alternating current motors.

The negotiations between the Arbroath Town Council and the Empire Electric Light and Power Company, London, for the introduction of the electric light into Arbroath have come to a deadlock. It appears that the Town Council wished the company to pay over 75*o*l. as the price of the provisional order obtained by the Town Council a year or two ago. This order was to be transferred to the company on payment of the above sum, which was to be retained by the Council in the event of the company failing to satisfy the Board of Trade that they were in a position to discharge fully and efficiently the duties and obligations which would be imposed upon them by the order and the deed of transfer. The company have refused to pay the 75*o*l. on these terms, and after more than a year's negotiations the company have intimated that they are not prepared to go on with the matter.

The British South Africa Company exhibited recently at their London offices a portion of the cable which has been

thrown across the Zambesi river at the site of the Victoria Falls Bridge, together with a photograph of this cableway at work. The cable consists of a steel rope of about 870 feet long, composed of six strands each of thirty-seven wires, and is 8½ inches in circumference, its breaking strain being 275 tons. Owing to the geological formation below the Victoria Falls no scaffolding could be erected for building the bridge, and it was decided to erect an aerial cableway, by which the material could be transported across the Zambesi, so that the bridge could be constructed from each bank simultaneously. The cable is suspended between two steel supports, one oscillating and the other a fixed standard "anchored," and a trolley or conveyer runs along the rope and carries the material over the river. The motive-power for working the trolley is electricity generated by a dynamo on the south bank of the Zambesi, and the whole is worked by a man who rides in the machine and controls the operations. The cableway was constructed in this country. In addition to the bridgework all the permanent way material, rolling stock and stores necessary for the extensions of the railway on the other side are being conveyed across the river by the cableway. Eight hundred tons can be taken across the Zambesi in a single day.

BUILDING AND BUILDERS.

The Smethwick Town Council have approved the plans for the erection of a joint infectious hospital at Holly Lane by the Smethwick and Oldbury Councils at an estimated cost of 19,525*l*.

The War Department have approved of the plans and estimates for rebuilding the Royal Artillery Theatre, Woolwich, recently destroyed by fire. The estimated cost is 5,800*l*.

The Brighton town clerk has informed the various firms who tendered for the execution of alterations at the Aquarium that owing to the refusal of the Local Government Board to sanction a loan of £16,000*l*. for the purpose none of the tenders can be accepted.

CHEDDLETON asylum, near Leek, was erected in 1899, with accommodation for 600 patients. On Tuesday the Staffordshire County Council authorised an expenditure of

92,000*l.* for the accommodation of 400 additional patients. It was stated that the total indebtedness of the county, amounting to fully 400,000*l.*, is almost entirely owing to the expenditure upon asylums.

It is stated that negotiations were concluded on Tuesday afternoon for the erection of a huge motor-car works at Alexandria, Dumbartonshire. The works proper will cover 20 acres, while 30 acres will be devoted to the building of workmen's dwellings. The capital of the motor company is half a million, and has been twice subscribed for. The works will give employment to over 1,000 persons.

THE Tower Bridge police court will be used for the first time on the 25th inst. The site was purchased for 19,000*l.* The cost of the court, together with the adjoining police station, has been 45,000*l.* The materials used for the exterior are granite, red bricks and Portland stone. The buildings were erected according to the designs of Mr. J. Dixon Butler, police surveyor, and are the first to be carried out under the direction of the Receiver of Metropolitan Police.

THE accounts prepared by the War Office under the provisions of the Military Works Act, showing the amount expended and borrowed to March 31, 1904, have been presented to Parliament. The amount issued to the War Office was 20,810,500*l.*, and the amount expended 10,256,729*l.* This sum has been expended as follows:—On defence works, 2,193,414*l.*; barracks, 5,714,464*l.*; ranges, 1,924,721*l.*; staffs, 424,129*l.* The defence works which were carried out at home stations cost 1,337,811*l.*, and foreign stations 854,770*l.* The outlay on barracks shows that 655,627*l.* was spent on the Aldershot district, 1,100,607*l.* on the south district, 498,706*l.* on Ireland, 586,303*l.* in the east district, 44,803*l.* in the north-eastern district and 25,404*l.* in Scotland.

THE London County Council have rejected a recommendation of the Building Act committee that leave should be granted for the erection of a row of shops 9 feet in advance of the present building line of the north side of Kensington High Street. The owner desired to partly cover the space now used as a garden.

VARIETIES.

THE Town Council of Langholm have selected Messrs. D. Balfour & Son, of Edinburgh, to report on a scheme of sewage disposal for the burgh.

Courts's old premises on the south side of the Strand, having been acquired by the London County Council, will be partly used by that body for offices. The ground floor will be let as shops.

A SYNDICATE has acquired property in Home Street, Edinburgh, for the purpose of erecting a theatre. The building is to accommodate 3,000 people. All the tenants have, it is understood, been warned, and operations will begin after the Whitsunday term.

THE Edinburgh School Board have approved of sketch plans prepared by Mr. Carfrae, the architect, of the school to be erected on the site acquired by the Board in Gillespie Street. The plans show a building capable of providing accommodation for 1,524 pupils.

THE Guildford education committee are considering the plans prepared by Messrs. Jarvis & Richards, architects to the Surrey County Council, for the technical school which it is proposed to erect in Park Street, Guildford, at a cost of 6,500*l.*

THE parks and baths committee of the Preston Corporation have decided to construct, at a cost of 650*l.*, an open-air swimming bath in Moor Park. It will be 100 feet in length and 60 feet in breadth, and its depth will vary from 3 feet to 4 feet 6 inches.

THE new War Office in course of erection in Whitehall is expected to be ready for use early in 1906. The contract with Messrs. Foster & Dicksee amounted to 447,000*l.* The work, which was designed by the late Mr. W. Young, is being carried out under the supervision of his son, Mr. C. Young, and Sir J. Taylor.

THE Aberdeen improvements committee have recommended the Town Council to proceed with the widening of Union-bridge from its present width of 40½ feet to 60 feet, granite to be the material employed. It is also recommended that, as proposed by Mr. Dyack, burgh surveyor, the top of the existing structure should be made watertight. The total cost of the scheme is estimated at 15,800*l.*

MATHER & PLATT, Ltd.
ENGINEERS,

Park Works, Newton Heath, **MANCHESTER.**

Queen Anne's Chambers, Westminster, **LONDON.**

A PUBLIC meeting held in Edinburgh last week approved of the project for the promotion of "an exhibition Edinburgh in 1907 of arts, science, industries, inventions, literature, produce and manufactures." The intention to illustrate the progress of the Scottish people from time of the Union with England in 1707. A site of acres is procurable at Murrayfield at a rent of 10s. an acre.

THE Brighton Council have approved of the scheme for paving of a portion of Madeira Road with tar, macadam of length of 1,100 yards. It is proposed to lay it in two thicknesses, with a thin coating of fine stuff on the top, which, when rolled and consolidated, should maintain a uniform thickness of 4 inches. The work has special reference to decision of the Automobile Club to go to Brighton for their motor week.

AN extensive sewerage scheme has been in progress at Cudworth, Yorkshire. The work includes the laying of pipes and the construction of outfall works. Since the laying of the pipes commenced the ground has in various places subsided from 1 to 2 feet, owing to the colliery workings underneath. The work has had to be stopped, and the engineer is instructed to make the best terms he can with the contractors.

At the Surveyors' Institute, Mr. A. L. Ryde sat as president, with Messrs. Henry Drew and C. W. Stephenson (secretaries) in a claim brought by Mr. Rendle against the Secretary of State for War for compensation in respect of compulsory acquirement by the Army Council of several thousand acres of land at Lydford for military purposes, including the formation of a camp. The usual notices to quit were served, but the holders claimed considerably more than was offered, and the present proceedings resulted. The amount claimed was about 150,000l.

DURING a discussion by the Wrexham Town Council the Brymbo sewage works it transpired that the outfall works had been placed on a farm and a twenty-one years' lease secured, but that time had expired, and under the terms of the lease all the works became the property of the landlord. Thus the Council had a thorough scheme of drainage, but no outfall. It was decided that steps be taken at once to purchase land on which to erect new outfall works.

At Carpenters' Hall on Thursday evening, the 16th inst., a lecture was delivered before a large audience by Mr. H. Phillips Fletcher, F.R.I.B.A., on "The St. Louis Exhibition, 1904." The chair was occupied by Viscount Dillon, and there were also present, among others, the Master (Mr. F. A. Crisp), the wardens (Messrs. A. B. Hammond and W. Robertson), Mr. J. C. Preston, Mr. J. Willson, J.P., Mr. Walter Smith, Mr. Percy Preston and the clerk, Mr. J. Hutton Freeman. The lecture proved thoroughly interesting, and was illustrated by a number of very fine lantern views, so that a realistic idea was conveyed of the varied extent of this wonderful show.

MESSRS. DAVID ROLLO & SONS, engineers, Liverpool, have offered to take two engineering students from Liverpool University into their works every year, allowing them to count the time spent at the University towards their apprenticeship. The condition laid down is that the students must have graduated as bachelors of engineering, preferably in honours. Thus a full apprenticeship can be served by three years at the University and two years with Messrs. David Rollo & Sons, making a total of five years. This arrangement will also satisfy the Board of Trade requirements, the Board having undertaken to recognise the time spent at the University under the faculty of engineering in the proportion of two years for every three years, but a total of four years' apprenticeship only is required by the Board.

TRADE NOTES.

THE new union infirmary, Poole, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues.

OUR contemporary, the *Timber Trades Journal*, has sent us a copy of their thirty-second annual special issue. It is a huge number, well printed, and containing much of interest to those interested in the building trades.

MESSRS. W. SUMMERSCALES & SONS, LTD., of Phoenix Foundry, Keighley, have been selected to supply the laundry machinery to the sanatorium now being erected for His Majesty the King at Midhurst, Sussex.

WROUGHT-STEEL SASHES.

THE insurance companies charge reduced premiums for buildings which have windows of steel and wire-woven glass. Messrs. F. Braby & Co., Ltd., of London and Glasgow, have introduced a new sash which will not only afford the security which belongs to steel, but will allow of partial or entire opening for ventilation. They have also the security offered by a "lock-joint." Cleaning no longer becomes a risky or troublesome operation with such a window. The sash consists of an upper and a lower part. The top can be opened from 4 to 6 inches, while the bottom part remains closed, but with a wider opening above the bottom sash becomes raised from 2 to 4 inches. In that way provision

is made for the passage of both incoming and outgoing air. Ventilation of a room or ward is therefore accomplished in the easiest manner. For hospitals and asylums the new window will be found to possess many advantages. By means of it municipal regulations for opening and cleaning windows can be complied with. Another advantage is that

with the window there is no need of boxing. They can be readily substituted for ordinary windows. Although the fittings were only lately offered for use they have been already introduced into hospitals, libraries, police-station schools, &c. Wire glass can be used with them.

CUSTODIS CHIMNEYS.

WE were among the earliest to recommend the adoption of the Alphons Custodis chimneys. The long list of tall chimney shafts which have been constructed on the patent system, as well as those which are in progress, is a testimony to the truth of what we said, as well as evidence of the superiority of the principle. Four stacks, each 275 feet by 19 feet, have been constructed for the new power-station at Chelsea. The Frodingham Iron Works have one 220 feet by 12 feet. The British Westinghouse Electric and Manufacturing Company will have two, 225 feet by 11 feet. Similar sizes have been adopted for the Clyde Valley Power Company. Messrs. Greaves, Bull & Laken have given a second order for a chimney 135 feet by 5 feet 6 inches. We have not yet, however, a chimney constructed by the firm in England which will rival one of theirs at Constable Hook, New Jersey, which is 365 feet in height, being the tallest chimney in America. The descriptive pamphlet just issued by the Alphons Custodis Chimney Construction Company has illustrations of many of the English examples, which form a most interesting collection.

MESSRS. VICKERS, SONS & MAXIM submitted to the Barrow education committee a scheme regarding their apprentices. In future all apprentices in the engineering and ordnance department will have to pass examinations in algebra, geometry, reading, writing and arithmetic. Apprentices are to be advised to attend the technical school, and any successes gained carry increased wages and a later hour for starting work in the mornings. Promotion to the drawing office is contingent upon attendance at the technical school's special classes. The firm have over 700 apprentices, and only about half now attend the technical school. The scheme will cost Vickers 900l. a year.

ELECTRO-GLAZED CASEMENTS.

ASS so quickly succumbs in fires, it is regarded with dread by firemen. It may on that account appear to have been most absurd to submit glass to such tests as the British Fire Prevention committee can devise. The trial was, however, arranged by the British Luxfer Prism Syndicate, Ltd., in order to display the power of resistance offered by their electro-glazed casements. The details of the severe experiments are published in an official "Red-book," No. 91. They were carried out under the direction of Mr. James Sheppard, who says of the windows:—"It is satisfactory to learn that with casements of this description it is possible to obtain protection to window openings against attacks from outside fires for a period of forty-five minutes. The importance of protection of this nature is shown by the large fires that have occurred during the past year where buildings have been involved by flame entering through the windows." With such an experience all scepticism about the resistance offered by the electro-glazed casements must vanish.

THE CITY ENGINEER COMPETITION.

THE full list of candidates for the position of engineer of the City of London, which has become vacant owing to the retirement of Mr. D. J. Ross, is, according to the *City Press*, as follows:—

Mr. W. N. Blair, Town Hall, Pancras Road.
Mr. W. Burch, Admiralty Office, Devonport.
Mr. S. E. Burgess, borough engineer, South Shields.
Mr. L. H. Chase, Runcorn.
Mr. H. W. Collier, Saltburn.
Mr. O. E. Collins, Guildhall, Norwich.
Mr. A. Fiddler, Guildhall, Northampton.
Mr. J. Hardasty, Longsight, Manchester.
Mr. J. F. Harrison, 1 Central Avenue, Partick, N.B.
Mr. W. T. Hatch, Metropolitan Asylums Board.
Mr. W. R. P. Hedderstedt, Orpington, Kent.
Mr. H. L. Hinnell, 41 Corporation Street, Manchester.
Mr. J. S. McKae, 17 Marine Terrace, Criccieth, North Wales.

Mr. W. R. Morris, London County Council Engineer's Office.

Mr. W. Oxtoby, Town Hall, Camberwell.

Mr. A. Pearce, Avonmouth Dock Works, Bristol.

Mr. N. Scorgie, Town Hall, Hackney.

Mr. F. Sumner, Town Hall, Woolwich.

Mr. C. H. N. Sutter, 7 Westview Terrace, Bray, Ireland.

Mr. J. E. Swindlehurst, city engineer, Coventry.

Mr. E. Van Putten, Town Hall, Catford.

Mr. F. Wood, engineer, Town Hall, Fulham.

RECENT CASES ON THE WORKMEN'S COMPENSATION ACT.

THE work of constructing a practical body of rules and definitions from the somewhat vague indications of the intention of the Legislature contained in the sections of and the schedules to the Workmen's Compensation Act goes on apace. Some recent decisions of the Court of Appeal have put constructions upon several words and phrases the meaning of which, in spite of the multitude of cases already decided, remained obscure.

The two cases of *Ellis v. Joseph Ellis & Co.*, and *Simpson v. Ebbw Vale Steel, Iron and Coal Company*, deal with the question, Who is a workman within the meaning of the Act? In the first named case a member of a partnership, formed for the purpose of working a mine, worked in the mine as a foreman at a weekly wage. While so working he met with an accident which caused his death. The Court decided that the Act had no application to a case of this kind. The Act contemplates a case where there is an employer and an employé. A person cannot, for the purposes of the Act, "occupy the position of both employer and employé." The work done in such a case by the acting partner is really a contribution in kind to the partnership assets. The wages paid him are really an extra reward for his extra contribution. To bring the case within the Act there must be on the one side an employer and on the other an employé who are different persons. That condition, as Cozens-Hardy, L.J., pointed out, would be satisfied in the

case of a workman employed by a company who received a share of the profits. It is not satisfied where a partner, by arrangement with the other partners, receives for work done sums of money, whether those sums are called wages or not.

In the second of these cases a more difficult question arose. In that case the manager of a mine at a salary of 400l. a year, a house rent free and coal, who was not required to do any manual work, was killed by an accident arising in the course of his employment. The Court decided that such a person was not a workman within the meaning of the Act. The difficulty of arriving at this decision was caused by the width of the language used in defining the term "workman." According to section 7, subsection 2, of the Act, "a workman" includes "every person who is engaged in an employment to which this Act applies, whether by way of manual labour or otherwise." Construing that definition strictly, it would seem to be a little difficult to exclude the deceased from the category of workmen. On the other hand, he was certainly not a workman in the popular sense of the term. The Courts have before now held that due regard must be paid to the fact that popular language is employed by the Act. Applying this principle it came to the conclusion that, as such a person as the deceased could not in common parlance be called a workman, he was not a workman for the purposes of the Act. As the Master of the Rolls pointed out, if the language of the Act were interpreted merely according to its grammatical construction, it might include such persons as solicitors and estate agents. He pointed out that the whole object of the Act was to help by a sort of State insurance persons who could not afford to insure themselves. The Act could not therefore apply to persons who were earning salaries which enabled the recipients to insure themselves. Moreover, the part of the Act which deals with the amount of compensation payable contemplates a person who is earning a weekly wage. The amount in case of temporary incapacity is not to exceed 20s. per week. This shows that it is not meant to be applied to the case of "a man who might be earning thousands a year." The exact line, the Court admitted, it was difficult to draw. Each case must be decided on its own facts.

The case of *Aylward v. Mathews* deals with the question of what is a building within the meaning of the Act. It was decided that a wooden structure exceeding 30 feet in height, used as a temporary platform for a crane which was employed upon a building, was itself a building. The Master of the Rolls pointed out that it was hardly possible to construe the Act unless the language used is considered in connection with the objects at which it aims. The Act seems to have contemplated that workmen were subjected to certain risks if they were employed upon the erection or repair of buildings over 30 feet in height. It therefore enacts that they shall be compensated if they are injured while so employed. They would obviously be subject to similar risks whether the thing which was being erected or repaired was a wooden platform or a building of brick or stone. Here, again, the question whether any given erection is a building within the meaning of the Act is one of fact.

The question whether building operations are an extension of an existing building or the erection of a new building may appear to be a somewhat academic question. That it may, however, be a very important question for builders and contractors is shown by the case of *Hartley v. Quick*. In that case a workman was employed upon certain additions to a building (over 30 feet high) which was used as an electric generating station. In the course of his employment he sustained injuries. At the time of the accident the walls of the new building did not exceed 30 feet in height. They were not yet joined to the walls of the existing building, but the foundations were made for them up to those walls. If the additions had been held to be an independent building the employers would not have been liable because they had not reached the height of 30 feet. The Court held that they were not a new building but a part of the old building, and that therefore the workman might be said to be engaged upon a building over 30 feet in height. It does not, however, follow that the Act will apply whenever new building operations are carried out which involve the use of a wall of an existing building exceeding 30 feet in height. The principle which governs this class of case was clearly stated by the Master of the Rolls. He distinguished the case of "an independent owner erecting an independent building by the side of an existing building" from the case where "the

rection of a new building is being carried out by way of extension of an existing building belonging to the same owner," in such a way that structural alteration of the existing building is involved. In the first case the building is an independent building—even though a wall of an old building may be used as a party wall. In the second case here is simply an extension of the old building.

The case of *Plant v. Wright & Co.* also dealt with the question of the circumstances under which a workman could be said to be employed upon a building over 30 feet in height; but here the question turned, not upon the nature of the building, but upon the character of the employment. The facts were that the employers had entered into a contract to do the plumbing-work connected with a factory and to measure up such work when complete. The accident to the plaintiff occurred while he was engaged in measuring up the work. It was argued that the work of construction was complete, and that therefore the workmen could not be said to be engaged in or about the construction of a building within the meaning of the Act. The cases in which it had been held that an accident occurring in the course of the removal of scaffolding from a completed building was an accident occurring in the course of the construction of the building could, it was said, be distinguished from the present case. In those cases the building was not actually complete till the scaffold had been removed. In this case the building was complete, whether or no the measuring was done. In fact, the measuring might not be done till many months after. The Court refused to allow the validity of this distinction. They regarded the measuring as part of the work of constructing the building, because under the contract the work must be measured before the price was paid. "From a business point of view," said Mathew, L.J., "the measuring up is in such cases an essential part of the process of doing the work." That the measuring was a material part of the performance of the contract may be admitted. But we feel inclined to ask whether everything which is material to be done for the complete performance of the contract is necessarily done in or about the construction of the building? The payment of the price is a very material duty to be performed in order to completely perform the contract, but it is hardly a duty in or about the

construction of the building. We should have thought that in this case the duty was rather a duty to be performed in or about the ascertainment of the price than in or about the construction of the work; but to the Court of Appeal it has seemed otherwise.

The much-vexed question of what is a scaffold for the purposes of the Act was again discussed in the case of *O'Brien v. Dobbie & Son*. The question to be decided was whether a simple ladder propped against a building 30 feet in height could be regarded as a scaffold. The Court of Appeal decided that it might be so regarded under some circumstances. Whether in any given case it was right to so regard it must depend upon those circumstances. "If," said Cozens-Hardy, L.J., "the prime and main use was as a staircase, then *prima facie* I should say it was not a scaffolding. If, on the other hand, the prime and main object was not to use it as a staircase, but as a sort of platform at various stages for doing works of construction or repair, then *prima facie* I think it ought to be regarded as a scaffolding."

The case of the *Castle Spinning Company v. Atkinson* raised the question of the proper construction of clause 13 of the first schedule to the Act. That clause in substance provides that, where a weekly payment has been continued for not less than six months, the employer may apply to have his liability redeemed by the payment of a lump sum, the amount of which shall, in default of agreement, be settled by arbitration. In this case the employers applied for diminution of the weekly payment or, alternatively, for its redemption by the payment of 150*l*. The Court of Appeal held that the right of the employer was to apply for the fixing by an arbitrator or by the County Court of a lump sum, and to pay the sum so fixed. He could not fetter the discretion of the arbitrator or the Court by naming a sum at which he desired the redemption to take place. Such a power on the part of the employer might, if the sum named were inadequate, lead merely to a fruitless inquiry. It was suggested that it might be convenient that the employer should be allowed to name a sum beyond which he was not prepared to go. That, however, was, as the Court said, a matter for the consideration of the Legislature.

It was decided in the case of the Great Northern Rail-

way v. Dawson that the value of a uniform worn by an employé in the company's service must be taken into consideration in estimating the workman's earnings, though the property in the clothes had not passed to the workman. The workman is benefited by the fact that the use of the uniform saves his own clothes; and the value of this benefit, rather than the cost of the uniform, must be taken to be the value of that benefit for the purposes of the Act.

THE HOLBORN AND FINSBURY ELECTRICAL EXHIBITION.

THIS exhibition, which has been organised by the County of London Electric Supply Company, Ltd., and is now being held at 118-122 Holborn, W.C., is of a very comprehensive character, and not less than sixty-five firms are taking part therein. It is divided into two sections, the one comprising lighting and heating and the other power. In the first-named section there is shown every variety of fittings for electric light, both for domestic and public purposes, a notable feature being the arc lamp display, which includes all the best of arc lamps, including the latest "flame" types. Worthy of notice, too, are the drawing and dining-rooms, which have been arranged by the County of London Supply Company. These are fitted in the latest style, and lighted and heated throughout by electricity. The same company have also arranged a suite of cottage rooms lighted on their slot meter system, and similar to the L.C.C. cottages at Tooting, which have been lighted by the company under this system.

An interesting development in electric lighting is shown in the shape of the Bastian and Cooper Hewitt lamps, which are illuminated by the current traversing a path of mercurous vapour; their great use at present is for photographic purposes.

In the power section all classes of machinery are shown actually at work. For instance, Messrs. F. W. Reynolds & Co. have a number of wood-working machines driven direct from the motor without any intermediate counter-shafting. The Electro-motor and Dynamo Co. show an excellent 2-ton hoist with motor self-contained, erected on tripod shear-legs. A similar hoist is also shown to run

on a girder as a traveller. These are actually at work and are of great interest to contractors and others. Motor-driven printing machines and pumps are also shown in operation. There is, moreover, on view a model of the admirable Richmond-Carey push-button automatic passenger lift in actual working, and this is well worthy of close examination. Messrs. Waygood & Co., Ltd., also show an electric service lift for carrying up coals, luggage, &c., which is very largely used in private houses, and found to be very convenient. Messrs. Penrose & Co. likewise have an interesting show of electric lifts and gearing; passenger lift with switch in cage; "Kryptol," a remarkable new substance for electric heating; mercury vapour lamps for photographic work and general illumination, and various other novel features in electric power and lighting.

CANADIAN PIG-IRON.

THE *Bulletin* of the American Iron and Steel Association states that the Association has received direct from the manufacturers the statistics of the production of all kinds of pig-iron in Canada in the calendar year 1904. They show an increase of 5,524 tons, or a little over 2 per cent., as compared with 1903, but a decrease of 48,615 tons as compared with 1902.

The total production in 1904 amounted to 270,942 tons, as compared with 265,418 tons in 1903 and 319,557 tons in 1902. In the first half of 1904 the production was 120,643 tons, and in the second half it was 150,299 tons, an increase of 29,656 tons. Of the total production in 1904, 251,671 tons were made with coke and 19,271 tons with charcoal. About one-fourth of the total production was basic pig-iron, namely, 70,133 tons. The production of Bessemer pig-iron, all made in the last half of the year, was 26,016 tons. Spiegeleisen and ferro-manganese have not been made since 1899.

The unsold stocks of pig-iron in Canada on December 31, 1904, amounted to 35,119 tons.

On December 31, 1904, Canada had fifteen completed blast furnaces, of which eight were in blast and seven were idle. Of this total, ten were equipped to use coke for fuel and five to use charcoal. In addition, three coke furnaces were partly erected on December 31, but work on the furnaces had been suspended some time ago.

Architect and Contract Reporter.

IMPORTANT NOTICE

TO THE

ARCHITECTS & CIVIL ENGINEERS OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

COLCHESTER.—April 13.—For school in Mill Road, Mile End. Block plan to be obtained from Mr. C. E. Denton, Educational Offices, Colchester.

KING'S NORTON.—April 26.—For the erection of a public library in Church Hill, King's Norton.—Architects must be resident in King's Norton or practising in Birmingham. Particulars may be obtained from Mr. A. W. Cross, surveyor, 10 Newhall Street, Birmingham.

RADCLIFFE.—April 29.—For the erection of a free public library. Premiums of 50*l.*, 30*l.* and 20*l.* will be awarded. General conditions and instructions, with an outline plan of site, may be obtained from Mr. S. Mills, clerk, Council Offices, Radcliffe, Manchester.

ROCHESTER.—May 15.—For the erection of a municipal technical institute at Rochester. Three premiums of 50, 20 and 10 guineas will be awarded. Copies of the instructions and a plan of the site can be had from Mr. W. Banks, surveyor, Guildhall, Rochester.

SWINDON.—April 14.—The education committee of the Town Council of Swindon propose to erect a public elementary school with accommodation for 840 scholars, and invite plans from architects. Mr. W. Seaton, Secretary to the Education Committee, Education Office, Town Hall, Swindon.

CONTRACTS OPEN.

ASHTON-IN-MAKERFIELD (LANCS).—April 18.—For the erection of a new administrative building, scarlet-fever and diphtheria pavilions, laundry, disinfector, stables and mortuary buildings, and other work at existing hospital buildings, for the Ashton-in-Makerfield Urban District Council. Messrs. Heaton, Ralph & Heaton, architects, Wigan.

BARROW-IN-FURNESS.—April 7.—For the erection of entrance gates, boundary wall and iron fencing to the abattoirs, and other work. Town Clerk, Barrow-in-Furness.

BATLEY.—April 5.—For the masons', joiners', plumbers', plasterers', slaters', painters', heating engineers' and electrical engineers' work respectively in the erection of the Carnegie free library. Messrs. W. Hanstock & Son, architects, Branch Road, Batley.

TRADE NOTES.

A LARGE clock, with dials facing south and west, has just been erected on St. John's Church tower, Kenilworth, by John Smith & Sons, Midland Clock Works, Derby. The same firm erected the great clock and chimes at St. Mary's Church, Warwick, three years ago.

THE Bath Stone Firms, Ltd., were able to declare a dividend of 16 per cent. for the second half-year. A sum of 20,000*l.* had been also added to the reserve fund. Mr. J. T. F. Turner, the secretary, pointed out that during a year of general depression in the building trade they had felt the advantage of having a manager like Mr. Cotterell.

ELECTRIC NOTES.

At the Newcastle Bankruptcy Court a restaurant proprietor attributed his failure partly to the tramway service, for "everybody goes home now that there are electric tramways."

The Chester Corporation have been considering the extension of their electric tramway service at an expenditure of 17,000*l.* The tramways committee have finally rejected the proposal to introduce motor buses, and recommend that the original electric-car system be proceeded with.

A DEPUTATION from the South Shields Town Council recently visited the principal towns to inquire into the subject of motor buses as an alternative to an electric tramway system. The opinion was arrived at that motor buses were unsuitable. This decision has been adopted by the Council, and tenders for the laying of the electric tramways will be shortly considered.

THE tramways committee of the Derby Corporation have considered tenders for certain extensions and for the provision of four new cars. The tender of W. Griffiths & Sons, London, for 18,689*l.* 2*s.* 9*d.* for the extensions is recommended for acceptance. The borough surveyor's and electrical engineer's estimate was 19,245*l.* The order for the cars is recommended to the Brush Electrical Engineering Company, Ltd., Loughborough.

THE Mersey Railway Company at their recent half-yearly meeting unanimously accorded a special fee of 5,000*l.* to the chairman of the company to remunerate him for his services in connection with the replacing of steam traction with electric traction. It was said that the chairman had devoted very considerable attention to the company, and had devoted an enormous amount of time to the arrangements and negotiations before the electrification of the line was completed.

BUILDING AND BUILDERS.

MR. GEORGE CARMICHAEL, the president, will take the chair at the twenty-seventh annual dinner of the Builders' Clerks Benevolent Institution on Tuesday, April 4.

It is estimated that a further sum of 737,000*l.* will be spent on barracks on Salisbury Plain, partly on new works and partly on continuation services.

THE Greenock Corporation have decided that only firms paying the standard rate of wages or piece prices to all competent workers for all classes of work, whether contract or otherwise, should be eligible to estimate for and receive Corporation contracts, and that all Corporation contracts should contain a clause requiring a contractor to pay the minimum standard rate of wages.

THE County Councils' Association have referred to the Parliamentary committee a suggestion from the Isle of Wight that County Councils should endeavour to obtain such legislative measures as would vest in them the right to specify to local authorities having the supervision of the erection of new property the widths and levels of main roads as well as the disposal of deposits constituting an obstruction or nuisance.

THE foundation-stone of the church of St. Erkenwald, York Road, Southend, has been laid. The church is intended eventually to accommodate 800, the cost being 15,000*l.*; but at present only the chancel and the first bay of the nave are being taken in hand, providing room for 450 and costing 5,500*l.* The site was given by Mr. William Gregson. The architect is Mr. W. J. Tapper, St. John's Wood, London, and the builders Messrs. F. & E. Davey, Ltd., Southend.

BURMANTOFTS TERRA COTTA

London Show-rooms:—2 & 3 Norfolk St, Strand, W.C.

THE Premier of New South Wales is said to be taking some steps in the direction of establishing ironworks in that colony. Reports on the subject have been furnished by the Public Works Department and the Mines Department, the former giving particulars of the quantity of iron required each year in connection with public works, and the latter supplying data as to available supplies of iron ore. The Public Works Department have been instructed to prepare conditions and specifications with a view of inviting offers for the establishment of works.

THE Surrey County Council are erecting a lunatic asylum at Netherne, near Reigate, at a cost of 360,000*l.* They have already borrowed 55,000*l.* for site, foundations and an approach road. A Local Government Board inquiry took place on the 23rd inst. into an application for 267,750*l.* for superstructure, water supply and heating. The estate of 354 acres was purchased for 21,895*l.* The contract for the building was signed on November 2, 1904, and was given to Mr. John Bowen, George Street, Birmingham, who was the lowest offerer among thirteen firms tendering. The average price of the thirteen firms came to 238,715*l.*, and Mr. Bowen's tender was 219,797*l.*

THE National Housing Reform Council passed the following resolution at a conference held in London on Saturday last:—"That this conference desires to draw the attention of local authorities in the suburbs and area of Greater London to the grave evils resulting from the lack of proper foresight in the planning of new housing areas and to the pressing need for the preparation and adoption of new by-laws to insure the ample provision of light and air space, gardens, &c., for workmen's cottages. Further, this conference is of opinion that Parliament should confer on local authorities various new municipal powers in regard to the preparation of building plans, the taxation of land values and the purchase of municipal estates similar to those powers already possessed by cities in the German Empire."

THE *Commercial and Industrial Gazette* (St. Petersburg) states that the Russian Society of Civil Engineers have drawn up the final programme of an exhibition of the latest improvements in building technics and in the artistic decoration and arrangement of houses and apartments. The exhibition is to be held at St. Petersburg, in connection with the All-Russian Conference of Civil Engineers in 1906.

Both Russian and foreign exhibits will be accepted, divided into the following groups:—(1) Structural art, materials in different forms and their application; (2) productions of the various trades and industries in connection with building; (3) sanitary construction; (4) technical fire-saving arrangements; (5) electro-technical appliances; (6) artistic decoration of dwellings, and internal and external finish of buildings; (7) special technical literature.

THE foundation-stone of the new church attached to the Devonport Royal Naval Barracks has been laid. The church will consist of a nave 40 feet wide, with passage aisles, chancel, side chapel, baptistery, vestries and organ chamber, and will seat 1,000 officers and men. A large choir vestry will be under the chancel. The materials are local limestone for the walling, with Portland stone dressings outside and Monk's Park stone inside. There will be an open timber roof to the nave, and a barrel roof with ribs to the chancel, these roofs being covered with green Westmorland slates. The aisles, chapel and baptistery will be roofed with concrete. The design has been prepared in the head office of the works department of the Admiralty. The work is being executed by Mr. A. Carkeek, contractor, under the supervision of Mr. W. J. Clarke, superintending civil engineer of Devonport Dockyard.

VARIETIES.

THE Lancashire Chancery Court have given their sanction to a scheme of arrangement and reconstruction of the Southport Opera House and Winter Gardens, Ltd.

THE naval dock at Bangkok is to be deepened and repaired in order to dock vessels of the size of at least 2,500 tons. The work, which is expected to take a year in completion, will cost about 50,500*l.*

MESSRS. GEO. ELKINGTON & SON, architects and surveyors, of 95 Cannon Street, London, E.C., who have been established at that address for the past forty-two years, have removed to larger and more commodious offices at Norfolk House, Laurence Pountney Hill, E.C.

INTERESTING TO ARCHITECTS.

The "**HERMETICA**" RADIATOR (Patented). For Rooms, Halls, Offices, Schools, Shops, &c. Requires no furnace and no replenishing with water. Each Radiator is self-contained. No trouble, no smell. Next to no cost for working. Railway companies use it for Waiting Rooms. The L.C.C. use it for Board Schools.

THE Beckenham District Council have decided to abandon the scheme for the construction of electric tramways, for which a Bill was promoted and passed in Parliament, in favour of motor omnibuses. There is a considerable feeling of hostility against this decision.

THE tender of Messrs. G. E. Wallis & Sons, of Maidstone, has been accepted for the building of a new isolation hospital and carrying out extensive alterations to the laundry at Barming Heath asylum, the amount of the contract being over 10,000/. Mr. W. J. Jennings, Canterbury, is the architect.

THE contract for the erection of a large viaduct over the river at Khushalgah, in Northern India, has been placed by the India Office with the Teesside Bridge and Engineering Company, of Middlesbrough. The bridge is of the double-deck type, carrying a railway on top, with a roadway below, and will have a 471 feet cantilever and an anchor span of 300 feet.

THE Tamworth Town Council have accepted a report from their sanitary and streets committee upon a scheme of sewerage for the borough and upon a scheme of sewage-disposal works jointly with the Rural District Council. They recommend that the joint sewage-disposal works be designed and carried out jointly by the borough and rural district engineers.

THE "Harmsworth Encyclopædia" has come and conquered. There are numerous works of its class, but if scale and price are considered it is without a rival. It is only necessary the read the articles on architecture, painting, sculpture and archæology to realise the extent of the information in the pages. The Encyclopædia will contain the knowledge which the majority of people require.

A PETITION was presented on Thursday to the Lambeth Borough Council from ratepayers and occupiers of premises in the Waterloo Bridge Road protesting against the removal of the wood paving in that thoroughfare and its replacement by granite setts. The importance of the roadway for the north and south communications in London is pointed out, and the creation of Kingsway, it is urged, will increase the traffic.

THE paving and highways committee of the Manchester City Council, recognising the tendency to increase the weight

of cartloads, have had all the bridges spanning the city rivers, streams and canals examined as to their fitness to bear the augmented strains without danger. In all cases where there is an indication of weakness the defect is to be promptly made good. The committee will not be contented with anything but an excellent margin of safety.

AN experiment is about to be made to develop canal transport by the use of liquid fuel for motive power. Mr. Norman Thomson, residing at Streatham, is building a 30-ton barge for the delivery of goods, and as a travelling warehouse from which goods may be sold. It is contended that by this method warehousemen would be able to reduce expenses for travellers and delivery. The Leeds and Liverpool Canal Company is adding to its fleet a 30-ton barge, to be driven by a 30-horse-power Diessel oil-engine, at an estimated cost of 1*d.* per mile.

A BILL authorising the construction of a dam at Keokuk Rapids, on the Mississippi, to cost a million sterling, has passed through the House and Senate at Washington. The proposed dam will be the greatest power-producer in the world except Niagara and the Assouan dam in Egypt. It is calculated that power—which will be converted into electricity and supplied for a radius of 100 miles—will cost about one-fourth as much as at present for South-west Iowa and parts of Illinois. This will make it the cheapest power in the United States. The projectors hope to have it ready in four years.

CERTAIN modifications have been made on the scheme for the construction of port works at Monte Video, in which comparatively little progress has been made since their inauguration in 1901. A decree provides for the introduction of a new system of constructing the wharves, which will enable them to be proceeded with at once, without waiting for the completion of the breakwaters. It is hoped they will be completed within three years from January last.

A LOCAL Government Board inquiry has been held at Smethwick town hall into the application of the Town Council for sanction to borrow 27,547*l.* for purposes of street improvements. About 26,000*l.* of the amount required was for the purpose of paving ninety-six streets of the borough which were unpaved. The other sums were

required for improvements, such as the widening of roads, &c. It is not proposed to deal with the whole of the matters at once, but to save the cost of another inquiry the whole of the work has been included.

THE Leeds City Council recently advertised for a sewerage engineer at a salary of 1,000*l.* a year. The applications numbered sixty-nine, and these were reduced to thirty. The sewerage committee have selected the following twelve candidates, who will be asked to appear before the committee on April 4:—D. E. L. Davis, Birmingham; James H. Frogley, Bolton; George A. Hart, Birmingham; R. E. W. Berrington, Wolverhampton; Francis Wood, Fulham; James McKie, Derby; H. H. Hellins, Dublin; Arthur W. Bradley, Bury; K. F. Campbell, Huddersfield; Alfred Fiddler, Northampton; Joseph Garfield, Bradford; J. S. Pickering, Cheltenham.

MUNICIPAL waterworks for Todmorden were opened on the 23rd inst. A reservoir has been constructed at Gorphey with a capacity of 130,000,000 gallons, which will provide a daily supply of 621,000 gallons. Five sand filters have been constructed of such area that the rate of downward flow at the surface of the sand will only be about 4 inches per hour when all the water is being used. At this very slow rate of filtration a gelatinous film of fine mud and microbes forms upon the surface of the sand, and so long as this film is maintained intact the most minute organisms cannot pass it. Mr. George P. Deacon, of Westminster, prepared the plans and specifications, and the contractor has been Mr. Benjamin Lumb, of Todmorden. Mr. Lumb's contract was 49,413*l.* 15*s.* 4*d.* The land cost about 8,000*l.*, the Water Act about 4,500*l.*, and the existing pipes within the borough 18,000*l.* The total cost of the new works will probably be just over 90,000*l.*

LORD AVEBURY gave an address on Tuesday before the London Chamber of Commerce on "The Great Increase of National and Municipal Expenditure." In the course of his remarks he declared the local authorities were running head over heels into debt. The outstanding loans of local authorities in England and Wales had risen in ten years by no less than 142,000,000*l.*, and now amounted to over 343,000,000*l.* It was said that much of the expenditure was on remunerative undertakings, but he much doubted

whether there was any real profit. Of course, when there was a monopoly it was easy to show a profit on paper, but all monopolies were bad, and those of Governments and municipalities were worst of all, because they could not be controlled.

PUBLIC CLOCKS.

THE world, it is said, does not know its greatest men, for they are often silent and secluded workers. In manufactures the same ignorance prevails. It is a familiar announcement "The trade supplied," but there are firms who without such a notification allow others to take advantage of their products. It is a system which is widely extended, but it may be doubted whether it is always to be recommended. Some men like to work for experts alone, and that may be one of the causes which has led to the practice. If anyone engaged in the manufacture of church and turret clocks were asked about the firm of Messrs. Sainsbury Bros., Ltd., of Walthamstow, they could not fail to testify to the importance of the establishment and the works which come from it. After a business career of more than a century the reputation of Sainsbury Bros. is too widespread to be disputed. Their co-operation has been continuous and extensive.

Having succeeded in the past, they are no less desirous to retain their supreme position in the future. For that purpose their factory at Walthamstow has been rebuilt and is being provided with plant of the latest design. There will be no difficulty henceforth in carrying out the orders of architects for clocks of exceptional size and quality and artistic treatment. There are few districts in this country in which their clocks are not to be found, and their long connection with Government departments is a proof of the perfection of their products as timekeepers, and which no foreign manufacturers have been able to surpass.

CARNEGIE BATHS, DUNFERMLINE.

THE new baths erected at the cost of Mr. Andrew Carnegie are now complete. They were designed by Mr. Hippolyte J. Blanc, of Edinburgh. The new bath buildings occupy a site in Pilmuir Street, along which they show a frontage of 260 feet. The total area of ground occupied is 3,300 square

yards, over which the plan is set out in three main attached groups, namely, the front, comprising entrance hall, reading and committee-rooms and offices, billiard-room, slipper baths, and complete suite of Turkish baths; second, the pond hall and relative accommodation for machinery and filter, engine-room, laundry, accumulator-room, &c.; and third, the gymnasium, dressing-rooms, instructors' rooms, superintendent's residence.

The main entrance is about the centre of the frontage in a projecting block of building of two storeys in height, flanked by two octagonal turrets. The entrance hall is very roomy, being 27 feet by 14 feet. All passing to the pond hall, gymnasium, or Turkish baths are required to pass the intercepting turnstiles. Those desiring the billiard-room only do not require to pass the stiles, but enter direct on the right of the entrance door. The billiard-room is a spacious lofty apartment 58 feet by 25.6 feet, furnished with three full-sized tables. Recesses on one side accommodate onlookers, and a deeply recessed oriel at one end of the room is set apart for those engaging in minor table games. The apartment is well lighted, both from clerestory windows and roof lights. The walls are panelled with wood 8 feet high. Pilasters divide the apartment in a series of bays.

The superintendent's office is on the right of the entrance hall, while from the left is entered a special room for ladies, with communication therefrom to the section of slipper baths set apart for them. Advancing to the inner vestibule (a large and well-lighted area 38 feet by 17 feet), access is given, on one hand, to the gymnasium, and on the other to the pond hall. The gymnasium is a large, lofty and cheerfully lighted hall, having a floor area of 103 feet by 45 feet. A shallow gallery on three sides is constructed for onlookers on occasions of display. The hall is decorated in soft tints of yellow, with stencil ornament in pale orange and green, and is furnished with the most complete and perfect equipment of modern gymnastic appliances. Probably nowhere in Scotland, if even in Britain, is there a more commodious or more perfectly equipped gymnasium of its kind. In connection with the gymnasium are commodious dressing-rooms, with lavatories and sprays in each. Instructors' rooms are conveniently situated.

The pond hall is, naturally, the chief feature of the

building. The water area is 75 feet by 35 feet, and on two sides are fifty-one dressing boxes entirely of teak. By an ingenious arrangement the space they occupy can be reduced by folding in the enclosures, so giving space for two extra rows of seats for gala occasions. Moreover, instead of the usual single pathway round the pond there are in this case two—that at the pond being specially and only for bathers, the second being for those entering and leaving the boxes. By this provision the pond water is kept free from the dust of boots. At one end of the hall are foot baths and sprays and superintendent's room. There is a gallery along three sides, and this accommodation, along with the movable seats in the area, affords sitting room on gala occasions for 1,000 persons.

The machinery for filling, heating, circulating and filtering the pond water are all provided in the basement floor, where are also a complete laundry, fitted up with wash-house, steam drying horses and steam calendar. The boiler for steam-power is of the Babcock & Wilcox type, capable of evaporating about 5,000 lbs. of water per hour. It provides the steam for hot-water supply for atmospheric heating of the whole buildings, also for Turkish baths, slipper baths, laundry, engines and pond.

The slipper-bath hall is a large, lofty and well lighted apartment, measuring 61 feet by 31 feet. It provides fourteen bath chambers, each with dressing chamber attached. There are also six spray and three douche apartments, together with sixteen separate dressing cubicles in connection. The baths are of special construction, perfectly fitted to their situation to prevent water getting in behind. For heating each department a flue from the basement is ingeniously contrived as a part of the bath, so placed as to prevent water getting access. The baths are of white glazed fireclay of special make, and each compartment is partitioned with green enamelled slate slabs, the doors having gun-metal mountings. The hall is divided in three main spaces, the centre—wherein are the baths—being warmed to a higher temperature than the sides, where are the dressing boxes. An attendant's passage is in the centre between the baths, and in this passage are all the fittings, exposed and under his sole control. A section of the bath hall is partitioned off for the sole use of ladies every day.

The corridor leading to the slipper baths continues to

the Turkish baths. These comprise sudatorium, tepidarium, shampooing-room, spray, Russian and plunge bath, also large cooling and dressing-room. The whole apartments are treated with faience tiling on walls, floor, &c., and where walls are plastered they are decorated in colour in soft tints. The cooling-room is a veritable Turkish apartment, with carved and decorated wood screens and wall surfaces all elaborately treated in positive colours of rich reds, blues and gilding, all forming a pleasing and attractive eye scheme, adding to the perfect comfort of the bath.

Externally the elevations are treated in a phase of the later Renaissance, and, says the *Dunfermline Press*, show at once to be a true rendering of the general plan of arrangement. The centre compartment, in which is the main entrance, rises much higher than the side compartments, which require top lighting and are therefore of single storey. On each side of the entrance are two octagonal turrets which terminate with shaped cone roofs, and with the centre gable rising between them form a very effective and pleasing group. The elevation of the wings is simple, composed of a series of compartments occupied with windows and divided with wall pilasters, terminating in ornamental finials above the roof parapets. The oriel of the billiard-room at the south end and the higher elevation of the Turkish bath group at the north end form pleasingly composed abutments, terminating the long range of the elevation.

Fitly symbolising the main purposes of the building are two bronze panels inserted in stone frames on faces of the octagon turrets. That on the south side illustrates the art of fencing, whilst that on the north side (near which the foundation-stone was laid in July, 1902) represents the art of swimming to the advantage of being able to save life.

For the heating and ventilation the best known methods to insure efficiency have been adopted. The electric-lighting system is complete and efficient, and includes one accumulator for emergency requirements.

Among the contractors were:—Builders, Messrs. James Stewart & Sons (Dunfermline); tile-layers, Minton, Hollins & Co. (Stoke-on-Trent), H. & R. Johnston (Cowbridge, England), Carter & Co. (Poole); enamelwork, Messrs. J. & M. Craig, Ltd. (Kilmarnock); baths, Messrs. Shanks & Co., (Barrhead).

THE HOLBORN AND FINSBURY ELECTRICAL EXHIBITION.

This interesting Exhibition, to which we briefly alluded in our last issue, will remain open until April 5 next, and in continuation of our notice of some of the principal exhibits we may mention that the Richmond-Carey patent automatic electric lift, a working model of which on a 3-inch scale is to be seen at the stand of Messrs. J. Richmond & Co., Ltd., can be used by anyone without the services of an attendant, while it is perfectly safe in operation, as the design of the controlling arrangements meets every possible contingency, with the view of rendering impossible the ordinary lift accidents. Messrs. J. Richmond & Co., Ltd., also exhibit passenger lift gear, forming one of a set for the Malta Tramways, with a capacity to raise 15 cwt. through a travel of 180 feet at a speed of 300 feet per minute.

The electric service-lift exhibited by Messrs. Waygood & Co., Ltd., which was also previously briefly alluded to, is operated by pushes on each floor, so that a child can manipulate it, while the cost for current is practically nothing. Electric-lift gear and accessories are also to be seen at this stand.

The Cooper Hewitt and Bastian lamps are shown at stand No. 42A by Messrs. A. W. Penrose & Co., who also exhibit at stand No. 62 the electric passenger-lift equipment, with car, showing switch in cage control, a half-ton electric warehouse crane equipment, and the Phoenix electrically-driven sensitive drill, as well as an electric breast drill, besides a Colt's armoury printing press, which is motor driven. Kryptol, the new patented resistance material for producing heat by electricity, which is attracting a good deal of attention at this stand, is admirably suited for the laboratory and workshop.

Messrs. Johnson & Phillips are showing hot wire instruments, arc lamps, porcelain insulators, cables and junction boxes, enclosed motor starters, as well as a specimen ventilating fan and Thirman cut-out.

Mr. W. Newton is exhibiting electric-light fittings, switches and accessories, besides specimens of electric radiators and ventilating desk fans.

Nor should mention be omitted of The Shannon, Ltd., who make a good display of the card index system as

applied to the electrical trades, as well as bill and letter filing, besides electric lamps for cabinets and desks, music and stationery cabinets, architects' desks, revolving tilt back chairs and the sectional system of building up cabinets by units.

The County of London Electrical Supply Company, it may be added, make a special feature of their power supply in the districts of Clerkenwell, Holborn and St Luke's, and have a very large number of power users connected to their mains. To those who have not yet adopted electric energy as a motive-power, the present exhibition will undoubtedly be of very great service.

NEW HEADQUARTERS FOR CADETS AT HAMPSTEAD.

A STRIKING illustration is afforded of the facilities afforded and the inducements held out to youths nowadays for making themselves efficient in military exercises by a visit to the new headquarters of the 1st cadet battalion of the Royal Fusiliers (City of London Regiment), which have just been completed at Pont Street, Hampstead, N.W., and which are perfectly equipped in every detail. The drill hall is of ample dimensions, admirably lighted by means of four of Humphrey's incandescent lamps in the centre and a Lucas light at each end. The window-frames as well as the roof supports are of iron, and there is a complete gymnastic equipment, supplied by T. M. Gardiner, of Hoddesdon, Herts. The armoury behind is capable of accommodating 900 rifles, and the fireproof system has been adopted throughout. There is a gallery in the front part of the hall, and leading off this are three rooms, with partitions, folding doors for meetings and general purposes.

Below ground is a shooting gallery for Morris tube practice, fitted with the Kerim electric light as well as with electric targets and indicators, and there is a magazine for ammunition built into the wall, while there is a store-room at the rear. Overhead is the admirably arranged canteen fitted with a Carrona kitchen, and mess-rooms for the officers and sergeants, besides bedrooms, bath-rooms and a store-room for accoutrements.

There is in addition a gunshed in which is stored a

Gardener machine gun and a conveniently arranged band practice room.

The architect is Mr. J. A. Tregelles, of 38 New Broad Street, and the builders are Messrs. T. Steed & Son, while Messrs. Purcell & Nobbs are responsible for the heating and lighting arrangements. The cost of the building and site, amounting to 8,000*l.*, was provided by Mrs. Wharrie, the daughter of Sir Henry Harbin.

TRADE MARKS BILL.

THE following explanation is appended to the Trade Marks Bill introduced by Mr. Moulton, Mr. Eve, Mr. Cripps, Mr. Butcher, Sir Albert Rollit, Mr. Cawley and Mr. Robson.

This Bill is intended to consolidate and amend the law relating to trade marks and to dissociate the law relating thereto from that relating to patents and designs. In preparing this Bill three main objects have been kept in view, viz. :—

1. To make the legislation which defines the essentials of registrable trade marks and the procedure for registering them more in accordance with the wishes and needs of the commercial community.

2. To separate the fundamental provisions of that legislation from the provisions relating to procedure. The latter is made by the Bill more elastic, and capable of being readily modified as experience shows best, and they are therefore relegated to rules which can promptly be amended if necessary.

3. To correct defects in the working and arrangement of the present Acts, so as to render the legislation simpler, more intelligible and more effective.

Some of the chief points in the present Bill are as follows :—

Clause 9.—The provisions as to registrable trade marks are made wider and more elastic so as to embrace many types of trade marks which, though excellent in practice, have hitherto been excluded from registration. Clause 10 deals with the question of coloured trade marks. Clauses 12 and 14 deal with applications for registration and oppositions thereto and appeals brought in respect of them. Clause 15 deals with the vexed question of disclaimers

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS
COMBINING LENSES AND PRISMS.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

Imperial Buildings, Ludgate Circus, E.C.

which has led to so much litigation in the past. It gives great freedom to the tribunal to require such disclaimers as are necessary to define the rights acquired by the registration, but provides that such disclaimers shall not prejudice any rights that do not depend upon that registration. Clauses 19-21 deal with the question of identical trade marks, especially such as arise from honest independent user before registration was established. Clauses 22-27 regulate cases in which a series of substantially similar marks are used by a firm on different goods—a very common and convenient practice. Clauses 28-31 provide for the renewal of registration at intervals of fourteen years. Clauses 32-38 deal with the important question of the rectification of the register in case of trade marks improperly registered or improperly omitted, and also with the case of disused trade marks. It also provides that trade marks already registered shall in case they are attacked have the benefit of the more liberal provisions of the present Bill as to registrability. Clauses 39-45 deal with the effect of registration and secure for the commercial community that which previous Acts probably intended to secure but failed so to do, *i.e.* that a trade mark that has been registered for five years shall be treated by all Courts as valid. Clauses 46-49 deal with legal proceedings relating to trade marks. The double procedure by motion and action is rendered unnecessary, and the rights of the parties and all consequent relief will be dealt with in one proceeding. Clause 50 gives the Court a wider discretion as to costs which will remove a widely felt hardship.

The other clauses of the Bill deal with the powers and duties of the Registrar of Trade Marks and of the Board of Trade and various miscellaneous matters.

A complete set of rules is scheduled to the Bill. These will be the rules when the new legislation commences. They will, however, be capable of being amended from time to time by the Board of Trade, subject to their being submitted to Parliament by being laid on the table of each House.

The subject is of so technical a character that it is impossible to give details of the provisions of the Bill or of the grounds on which they rest. But in the preparation of the Bill every effort has been made to ascertain the views of those who are most interested in trade marks, and of

those who have the greatest familiarity with the administration of the present Acts and the judicial decisions thereunder, and it is believed that the provisions of the present Bill accord with these views in all substantial matters.

REGISTRATION OF PLUMBERS.

THE annual meeting of registered plumbers under the jurisdiction of the Birmingham and District Council was held in the council-room of the Midland Institute. Mr. John Price (city surveyor) presided. In moving the adoption of the report the President said the principal matter referred to in it was the question as to when the time for registration without examination should terminate. The representative committee decided that after December 31, 1904, no plumber should be registered unless he had passed an examination approved by the committee, but in consequence of several of the councils having failed to carry out that decision, the representative committee had extended the time till December 31, 1905. The Council were anxious that no further extension of time would be granted, for it was very desirable that a practical test as to the efficiency of masters and men should be speedily and uniformly adopted. He hoped that the plumber who did not know his business would soon be a thing of the past. The accounts showed a balance in hand of 103*l.* 5*s.* 1*d.*

The annual report of the Manchester Council stated that the Manchester education committee had been approached with a view to a representative of the building trades being co-opted as a member of that body. The Council were informed that the scheme of co-option did not provide for further representation in the direction indicated. It was also recorded that a deputation from the Council was received by a sub-committee of the paving, drainage and highways committee of the Manchester Corporation, when the Corporation were asked not to place upon its list of "authorised plumbers" any person who had not received a proper training. The gas and water committees declined to receive this deputation. "It has since been pointed out," added the report, "that the official authorised list contains the names of men who have no connection with even the building trade, and your Council still hope for a revision."

IMPORTANT NOTICE
TO THE
ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at
43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

COLCHESTER.—April 13.—For school in Mill Road, Mile End. Block plan to be obtained from Mr. C. E. Denton, Educational Offices, Colchester.

HIGH WYCOMBE.—May 31.—Secondary school, accommodation for 175 pupils. No premium offered. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, High Wycombe.

WHITSTABLE.—April 11.—For the enlargement of the county police station at Whitstable, Kent. The County Architect, 86 Week Street, Maidstone.

THE Local Government Board recently held an inquiry into an application by the Boston Town Council for a loan of 20,000*l.* for electric lighting. The scheme has not found favour, for the plans have since been returned, with various suggestions and recommendations, and they call for a revised scheme on a broader basis, and the appointment of a consulting electrical engineer. The Board are not satisfied, upon the information before them, that the establishment of an electric-lighting installation in accordance with the scheme as at present designed would be likely to be successful from the financial point of view. The Board think also that it had not been satisfactorily shown that there would be any material improvement in the lighting of the streets, and looking to the arrangement of the arc lights shown on the block plan, it was even possible that the illuminating effect of the electric light might be inferior to that of the present method of lighting by gas. The Board are also advised that the arrangement of the generating station is capable of considerable improvement, especially with regard to possible future extensions.

MAY-OATWAY FIRE ALARM.

WHAT USERS SAY.

Messrs. J. Thomason & Sons, Spinners, of Bolton, write:—"A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily, 10 minutes before the Automatic Sprinkler went off." Loss £48. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works, Edinburgh, write:—"A fire broke out in our factory during the dinner hour on January 18, 1905, when the May-Oatway installation (put in since our previous fire) saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well." Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.C., Premier, writes:—"This system has been largely adopted in New Zealand, and has given the greatest satisfaction." (The Government are the largest users protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—"Fire March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss." Claims paid, £10 and £60 respectively. What have you done to limit your loss?—

Send for circular, or call and inspect 94 Paul Street, E.C.; Glasgow, Liverpool and Manchester.

RÜNTZ & FORD v. BAKER.

JUDGMENT was delivered by Mr. Justice Wills on the 31st ult. in a case of importance to the architectural profession and to builders, which was heard on Wednesday and Thursday by his Lordship and a special jury. Mr. Danckwerts, K.C., and Mr. E. M. Pollock (instructed by Messrs. Edwards & Cohen) appeared for the plaintiffs, Messrs. Ernest Rüntz & Ford, architects, of Walbrook, and Mr. Dickens, K.C., and Mr. Francis Watt (instructed by Messrs. Webster & Webster) appeared for the defendant, Mr. Sidney H. Baker, a surveyor, of 62 Coleman Street, E.C.

The action arose in the following manner. The defendant was desirous of erecting some superior and artistic suburban properties, and instructed the plaintiffs to prepare plans and

drawings for the erection of some houses of this kind on his estate at East Finchley, and certain houses were pointed out by the defendant to the plaintiffs as possessing internal arrangements which he would like followed. An amount was agreed upon for the preparation of plans and drawings, quantity surveyor's fees and the supervision of the building. The defendant did not want to spend more than 1,000*l.* to 1,200*l.* per pair, but the plaintiff, Rüntz, stated that he pointed out to the defendant that if the houses were to be of similar accommodation to those he had been shown at Muswell Hill, the cost would be more than this figure. Several sketches and sets of plans and drawings were prepared by the plaintiffs and submitted to the defendant, which he desired modified in certain particulars, and the quantities having been got out tenders were invited from different builders, the lowest received being for 2,250*l.* per pair. The result of the tenders was made known to the defendant, who objected to the amount required to build the houses, and various conferences took place between the plaintiffs, defendant, the defendant's builder, Collins, and the quantity surveyors with a view to reducing the cost of the houses, and a list of suggestions prepared by the quantity surveyors and the builder which would reduce the cost of the houses to about 1,640*l.* was submitted to the defendant, but no decision was apparently arrived at. The plans and drawings were afterwards returned by the defendant to plaintiffs with an intimation that he did not require them. Some time afterwards the plaintiffs had their attention called to the fact that five houses had been erected on the land at Finchley, and it was found that the houses as erected were practically identical with those designed by the plaintiffs, and they therefore claimed a proportionate part of the agreed fees, which the defendant declined to pay. Expert evidence was called on both sides, and Mr. Justice Wills sat until five o'clock on Thursday evening to finish his summing up, in the course of which he mentioned that in his opinion the artistic designs of the plaintiffs had been used in erecting the houses, though the modifications that had been made for the defendant deprived them of much of their beauty. The jury, after retiring to consider the matter and inspect the various sketches, plans and photographs, returned a verdict for the plaintiffs.

TRADE NOTES.

THE Brilliant Sign Company, Ltd., have been informed by their Cape Town house that they are the recipients of a diploma for a bronze medal for brilliant signs and letters exhibited at the recent Cape Town International Exhibition. They are the only firm in the trade to whom a diploma was awarded for excellency of work. This recognition confirms the experience in England and elsewhere.

MESSRS. A. L. GIBSON & Co. have received the order for four Kinnear steel rolling shutters for the motor garage at the Hôtel Metropole, Brighton—two single shutters and two filling a wide opening divided in the centre by their hinged post which, when the shutters are raised, can be hoisted out of the way so as to leave the whole opening clear. The Kinnear shutter has hitherto been largely used in this country for tramcar depôts, but is now finding an extended field of usefulness in connection with the establishment of motor garages as an adjunct to hotels and other large establishments. The shutter meets a necessity which otherwise could not be readily served.

WE desire to draw the attention of our readers to the advertisement of the Builders' Exchange, Birmingham. The exhibition, soon to be opened, is to be permanent, and is intended for the purpose of facilitating business with builders and buyers of the productions of Birmingham, the city which has the closest connection with building.

THE committee of the Cyclists' Touring Club recently met at 47 Victoria Street, Westminster, when they learned that nearly sixty devices have been entered for competition for the large monetary prizes offered for a satisfactory solution of the side-slipping problem, while at least an equal number of inventors have put forward their theories without actually entering. The trials themselves will probably take place in the neighbourhood of London during Whit-week, upon natural and artificial surfaces calculated to test the merits of the devices to the utmost.

ELECTRIC NOTES.

THE British Consul-General at Antwerp announces that tenders will be opened on the 12th inst. for the supply of electric-lighting materials for the Belgian State railways.

THE tramways committee of Leith Town Council have resolved to adopt the grooved trolley wire for the new electric tramway system, and a remit was made to the sub-committee to accept offers for the overhead equipment.

THE general works committee of the Coventry City Council on Tuesday decided to recommend the Council not to go further with the proceedings against the Coventry Electric Tramways Company in respect of the alleged delay in the construction of the tramway extensions in Albany Road.

At Manchester an elaborate method for the distribution of parcels in connection with the Manchester Corporation tramways has been inaugurated. Parcels will be collected and delivered several times daily not only in the city, but in every suburb, and will be forwarded to their destination by tramways or special goods vans.

At Aberdeen the Town Council will alter the rule as to disconnecting the electricity demand indicator, so as to provide that consumers on any particular occasion, but not exceeding one in each month, and three days at one time, requiring an extra supply of electricity, might, by giving the Corporation twenty-four hours' notice in writing, have arrangements made whereby their indicators would not register the demand on the occasion so notified.

THE Midland Railway Company have asked for an abatement in the assessment of their lines within Bradford by reason of the competition of the Corporation trams. The committee have offered a reduction of 3,000*l.*, which will mean a loss to the Corporation revenue of 1,250*l.* The takings of the Bradford City Tramways for the twelve months ended March 25 show an increase over the preceding year of 3,136*l.*

THE cleansing and lighting committee of Edinburgh Town Council have recommended that an expert be consulted as to the illuminating power of both the gas and electric light of the city, while in view of the conversion of the ordinary gas lamps to incandescent the town clerk was

instructed to ask the Gas Commissioners at what price they would supply gas for the public streets and stairs, and whether they would be willing to enter into a contract with the Corporation.

THE Belfast Corporation have received the award of Mr. L. Macassey in connection with the Belfast Tramways arbitration. The gross total claimed by the company in respect of the sale of the undertaking was 452,345*l.* os. 2*d.*, less 60,000*l.*, being the amount of principal monies secured by the company's outstanding debentures. The total estimate of the Corporation, making the same allowance in regard to the debentures, was about 260,000*l.*, so that there was a difference of over 130,000*l.* The arbitrator, after deducting the debentures for which the Corporation became liable, awarded 296,948*l.* 14*s.* 6*d.* to the company and 7,500*l.* for compensation to the directors, manager and secretary, making in all 304,448*l.* 14*s.* 6*d.*

BUILDING AND BUILDERS.

MR. T. G. HUXLEY, of Malpas, Cheshire, has undertaken the erection of new schools at Rhos, near Ruabon, for the Denbighshire education committee, his tender amounting to about 8,000*l.*

THE citizens of Norwich have purchased a site of 20 acres for 2,500*l.*, which will be presented to the War Office to be used for cavalry barracks, to replace the present buildings, which were condemned. The new barracks will be erected at an estimated cost of 200,000*l.*

THE Aberdeen painters resumed work on Monday, after being on strike a month. At the conference the masters conceded to five of their demands, namely, minimum instead of standard wage, the adoption of a rule against scamping work, a by-law regulating the number of apprentices to be employed in proportion to journeymen, and an annual conference prior to the adjustment of each year's trade by-laws.

MR. JAMES A. GORDON, a well-known North of Ireland contractor, was riding on Sunday from Donaghadee to Newtownards, near Belfast, on his motor-bicycle, when, in taking a sharp turn at a place known as the New Road, the

wheel skidded, and Mr. Gordon was hurled against a wall and killed instantaneously. Mr. Gordon was fifty years of age. He had building contracts on hand in Glasgow and Ulster.

NOTICES of reduction of one penny per hour in wages of masons, bricklayers and plasterers employed in the building trade of Sunderland and in the Tyneside district have been served. The labourers are also asked to submit to a reduction of halfpenny per hour. Prior to the issue of the notices conferences were held between the representatives of the employers and the men. The notices of the men expire on May 26.

THE Dublin Corporation, at a meeting on the 3rd inst., passed the following resolution, together with the addendum, "That this Council, having in view the best interests of the citizens and the general prosperity of the city, expresses its most earnest desire that the present dispute in the building trade be terminated, and thus obviate the distress which has ensued consequent on such dispute. And that we call upon the Master Builders' Association to permit the men to return to work on their old terms pending the result of arbitration."

THE Public Health Acts (Amendment) Bill, which Lord Hylton introduced into the House of Lords, contains a provision which, if adopted, will largely facilitate the erection of country labourers' cottages. It is to the effect that buildings (not being public buildings or factories) situate at a certain distance from every boundary of the curtilage, and at a distance of not less than 30 feet from any other building, shall be exempt from the operation of the building by-laws in force in any county district.

In the presence of a crowded assembly on the 30th ult. Lord Roberts opened the new hall which forms the latest adjunct to the Uppingham School buildings, and is the old Uppinghamians memorial to their comrades who fought in the South African war. Lord Roberts was accompanied by his daughter, Lady Edwina Roberts, and also among those present were the Marquis of Exeter, Lady Lilford, Lady Carbury, Sir Arthur Fludyer and Lady Fludyer, Major the Hon. and Mrs. P. Evans Freke, Capt. Jones, &c. The stone employed for the building was Edithweston and was supplied by Messrs. Woodforde & Wing, of Stamford.

THE North-Eastern Railway Company are erecting a large goods station in Newcastle which will be the biggest single building in the city. There will be lines and platforms for accommodating six trains simultaneously. The warehouse will be built throughout of ferro-concrete, on the Hennebique system—concrete reinforced with steel bars. The floors and other parts of the structure have been subjected to severe tests. Two beams of 28 feet and 35 feet span respectively were loaded with 205 and 257 tons, the deflection did not exceed three-eighths of an inch.

THE Birmingham Corporation purchased in 1887 17 acres of land at Bordesley Green as a site for municipal workmen's dwellings. The scheme was abandoned in 1902, and the housing committee are now considering an offer from Mr. H. Taylor, Small Heath, to take the land on a 99 years' lease and to erect buildings according to the conditions. It is contemplated to build not less than 30 and not more than 340 houses on the land, to be let at rentals of 4s. 6d. and 5s. There will be a plot of ground in the centre and no licensed premises will be permitted. After making roads, &c., the city will have to wait fifty-six years before any profits in the shape of ground rents accrue to the ratepayers.

THE Atherstone District Council on Tuesday discussed a letter from a local solicitor, on behalf of a number of large ratepayers, drawing attention to the great injury which was being caused to the district by the "irksome construction and enforcement of the antiquated building by-laws of 1876." Building operations were said to be practically at a standstill, and this was entirely owing to the increased cost of erection. The writer stated that thirty-six houses were about to be built in the Nuneaton district, which might have been put up in the Atherstone district, but by building them in the former locality the owner would effect a saving of 360l. They urged the Council to take steps to relax the present regulations, which curtailed the rateable value of the district, restricted the employment of labour and injured the welfare of the community at large. The matter was referred to a committee.

THE opening ceremony of the new buildings for the United Methodist Free Church and schools, Seven Kings, took place on Thursday, April 6. The portion of the build-

ing which has been erected embraces the church nave and temporary apse, also a bold, square tower with open traceried parapet, and surmounted by a spire and finial vane rising to a height of 91 feet; also main schoolroom 51 feet by 40 feet, together with superintendent's room, &c., and the usual conveniences. The building was designed by Messrs. George Baines & Son, 5 Clement's Inn, Strand, W.C. The contract amount for this portion was 3,488*l.*, and the church accommodates 400 persons in a mixed congregation. The facings are of red brick, the dressings in Bath stone. The seating and internal joinery is of fumed oak wax polished. The building is intended to be extended in the future, by transepts, apse and vestries, and a corresponding addition under same to the schools, giving a future accommodation of 700 adults in the completed church.

VARIETIES.

A NEW bridge constructed across the river Exe, at Exeter, at a cost of about 25,000*l.*, has been opened. The structure was designed by Sir J. Wolfe-Barry and Mr. C. Breton, and has been erected under their supervision.

MR. BENT, the Premier of Victoria, has (says a *Daily Chronicle* cable) ordered machinery for State brick works, in pursuance of his declaration that the brick combine is artificially maintaining prices and must be fought.

THE surveyor of Montgomery Town Council complained recently that it had taken the Cambrian Railway six days to transmit some piping from Welshpool to Montgomery, six miles.

MR. ARNOLD-FORSTER, the Secretary for War, has officially stated that the expenditure under the Military Works Acts for the year ending March 31, 1905, will amount to about 3,370,000*l.* The expenditure to be incurred in 1905-6 is still under consideration.

THE Leeds sewerage committee on Tuesday reduced the sixty-nine candidates for the post of engineer to the following three:—Mr. Hart, chief assistant engineer to the Thame and Rea District Drainage Board, Birmingham; Mr. Garfield, Bradford sewerage engineer; and Mr. Fidler, borough engineer and surveyor of Northampton.

THE building trade in the Ruabon district of North Wales is now looking much brighter. The brickworks and collieries are becoming busier, and work appears more plentiful than it has been for some time past, several large contracts having recently been settled.

THE Rugby Board of Guardians decided on Monday to build a new infirmary in the workhouse grounds, in order that the existing infirmary may be utilised to relieve the present congestion in the workhouse. It was also decided to erect two dormitories over the girls' day-room.

THE West Bromwich District Hospital Board of Management has decided to at once undertake the erection of a separate nursing block in the hospital grounds. The proposed buildings will accommodate twenty-four nurses and will cost 3,000*l.*

A PROFESSOR at the French Academy of Medicine stated that as the result of elaborate experiments with the dust from many streets in Paris he had found that a pound of the dust from the Rue de Rennes contained 1,300,000 microbes, and a pound of that from the Rue Monge contained 2,100,000.

THE Darlington tramways committee, at a meeting last week, decided by a large majority to recommend to the Council the abolition of halfpenny fares, which were adopted as an experiment with the commencement of the year. It is computed that there was a loss in consequence of the reduction to a halfpenny of 4*l.* to 5*l.* per week.

ABOUT 1,200 square feet of patent interlocking rubber tiling of Messrs. Arthur L. Gibson & Co. have been laid on the public portion of the ground floor of the new Shipping Exchange in Cockspur Street. This is a suitable arrangement, for the tiling is largely used in British and American steamers, battleships and yachts.

THE Millport Town Council have adopted a scheme of water supply prepared by Mr. T. O. Niven, C.E., who reports that he can give a reservoir with a capacity of 15,000,000 gallons, the cost of which, with filters and piping throughout the town and all other necessary work, he estimates at 5,915*l.*

THE Kensington Borough Council, having a surplus of 36,000*l.* owing to alterations in the rates made by the County Council for the payment of precepts, will utilise

31,000*l.* of the amount for payment of outstanding loans on wood-paving works. Such works will in future be paid out of revenue instead of by loans. The present loan debt of the borough is more than a quarter of a million.

AUTOMOBILISTS are being approached by the promoters of a scheme for the construction through the Landes country of a grand macadamised promenade, 65 feet wide, and extending from Arcachon to Biarritz. The route which is proposed would through its entire length skirt the ocean at a distance of about 400 yards, and be exclusively reserved for automobiles and cycles.

THE Blackpool Town Council discussed for three hours on Tuesday the question of the public lavatories now in course of erection on the new promenade. Some members were of opinion that the lavatories were undesirable and should be pulled down. Others were in favour of finishing the work and allowing it to remain for a season to see how it answered. Finally the casting vote was given in favour of the completion of the work.

THE new Durham and East Coast branch of the North-Eastern Railway between Seaham Harbour and Hartlepool was opened on Saturday for passenger traffic. The line will afford easier communication between Sunderland and West Hartlepool. The new line is 9 miles long, and skirts the coast all the way. It crosses a number of gorges at great height. One of these, at Hawthorn, built of brick, is 104 feet high, and has one span of 120 feet, the largest brick arch with one exception on any British railway.

A LOCAL GOVERNMENT BOARD inquiry was held at Hereford last week respecting an application of the Town Council to borrow 3,000*l.* to pay for the extras in connection with the building, at a cost of 20,000*l.*, of the new town hall. Two items in the amount of extras, amounting for 1,611*l.*, were caused by the discovery that the site for the new building was faulty, there being at the rear the remains of an old moat, which constituted a part of the earliest defences of the city.

PLANS have been prepared by the surveyor to the Government of Natal for new sewage-disposal works at the base camp of the Chinese labourers at Durban. The scheme includes the provision of a septic tank of 35,000 gallons capacity, i.e. sufficient to hold one day's dry weather

flow, and continuous percolation filter 46 feet diameter 15 feet deep, fitted with the Fiddian automatic sewage distributor, the order for which has been placed with Mr. Birch Killon, of Manchester.

THE first sod was cut on the 3rd inst. in connection with the works for the introduction of a gravitation water supply from the Noran to Arbroath, a distance of about 20 miles. Mr. Hogg, of Messrs. Crouch & Hogg, Glasgow, the engineer for the scheme, stated that critics of the scheme had prophesied that the estimated cost, 80,000*l.*, would be exceeded, possibly doubled, before the works were finished. He was prepared to stake the reputation of his firm that the undertaking would be completed within the four corners of the estimate.

THE Liverpool city lighting engineer, Mr. C. R. Bellamy, has issued his report for the year 1904, from which it appears that the city is lighted by 18,360 public lamps, the maintenance charges being 47,648*l.*, as compared with 40,881*l.* in 1893, the year prior to the lighting being taken over by the Corporation, showing that while 168½ miles of street lighting have been added, increasing the number of lamps by 65 per cent. and the aggregate illuminating power more than quadrupled, the charges are only 16 per cent. greater.

PROVISION for further alterations in the ventilation of the new Palace of Westminster is made in the Estimates for 1905-6, a sum of 700*l.* being set apart for continuing the work of carrying out the recommendations of the select committee on House of Commons ventilation, 250*l.* being allotted for improving the ventilation of lavatories, and about 2,000*l.* being devoted to improving the heating appliances of the chamber and contiguous offices, altering smoke shafts, purifying the atmosphere of the members' tea and reading-rooms and the Westminster Hall grand committee-room and works of a minor character.

THE Foreign Office issued on Tuesday a report on the trade of Mexico in 1903. There is a very great falling off in the value of the iron girders imported in the year 1903, the value being only 47,387*l.*, as compared with 111,459*l.* in 1902. During the last six months the imports were:—From Belgium 5,926*l.*, from the United States 5,148*l.*, from Germany 4,148*l.*, from France 2,199*l.*, but from the United

States only 360/. The importation of iron or steel sheets for roofing amounted to 133,756/, as compared with a value of 146,120/ in 1902; and from the statistics published for the last six months of the year the value of these goods from the different countries was as follows:—The United Kingdom, 58,546/, the United States 17,187/, and Germany 7,316/.

THE London Metal Exchange and the Scottish Pig-Iron Trade Association recently had a misunderstanding as to what constituted "good delivery" in "A.G." standard foundry iron contracts, with the result that serious complications took place in extensive speculative transactions between London and Glasgow, and gave great concern. The Scottish Association has now fallen into line with London, and has issued a circular naming the brands passed as deliverable "A.G." and "A.A." contract for standard foundry pig-iron. By this arrangement Lanarkshire and American pig-iron become good deliveries.

AMUSEMENTS.

The Coliseum.

THE handsome building erected by Mr. Frank Matcham at the corner of St. Martin's Lane, London, is a great success, and is crowded at each performance. The entertainment provided is of the highest possible class, thoroughly refined, and this probably accounts for the crowded houses. Undoubtedly at the present time there is no place in London where such a pleasant afternoon or evening can be spent—a well-ventilated and handsomely decorated hall, a place of amusement where all can see and hear with comfort, and a programme which cannot be excelled. The singing of Miss Winifred Hare and Madame Alice Esty, with the Coliseum Auditorium Choir, is an intellectual treat for all lovers of music. Those of our readers who have not yet visited the London Coliseum should take an early opportunity of doing so. We have described the building itself on a former occasion, and both programme and building are well worthy of one another.

Brixton Theatre.

WE congratulate Miss Jean Sterling Mackinlay upon her success in so ably portraying the character of "Sunday" in Mr. Thomas Raceward's play of that title, which is now charming the audiences at the Brixton Theatre. There are not many actresses who could have attempted and succeeded so admirably in following up Miss Julia Neilson's creation of "Sunday," for its spirit, pathos and American accent combined make it a difficult character to copy. But Miss Mackinlay keeps her audience in spellbound attention, scoring strongly with her winsome, guileless faith and defence in and for her rough stirring and Wild-West guardians. Mr. F. E. Pearce is admirable in the part of Colonel Brin thorpe. All the other characters are well sustained, and the scenery is pretty and effective, especially the Terrace of Brin thorpe Abbey. Altogether, Mr. Louis Calvert is to be congratulated upon the complete success of his undertaking.

CADET HEADQUARTERS, HAMPSTEAD.

WRITING from the Hampstead Headquarters of the 1st Cadet Battalion the Royal Fusiliers (City of London Regiment), the commanding officer, Lieut.-Colonel Frank Sheffield, wishes to draw attention to the opening ceremony which has been fixed by the Prince of Wales, colonel-in-chief of the Royal Fusiliers, for Monday evening, May 15. In the course of a careful preliminary inspection of these headquarters, His Royal Highness was pleased to express unqualified approval of their extent, architectural appearance and general completeness, in which respect they are unsurpassed by any similar buildings in the Metropolis. The battalion receiving no Government aid, is entirely dependent on voluntary contributions; and Colonel Sheffield points to the gratifying fact that on the total expenditure incurred there remains the comparatively small indebtedness of 2,000/. It is naturally desired that this balance should be raised before the opening day, so that the Prince of Wales may enjoy the additional pleasure of announcing that these admirable headquarters have no burden of debt resting upon them. For this purpose Colonel Sheffield relies upon the public interest in this unique development

of the Volunteer movement, and he will be glad of communications upon this subject addressed to him at the Headquarters, Pond Street, Hampstead, N.W.

A QUARRYING FEAT.

An interesting event took place in the island of Portland on March 25 in the famous Kingbarrow Quarries of the Bath Stone Firms, Ltd. From these quarries the stone has been excavated for the erection of the new Government buildings at Whitehall and the new War Office. What is known locally as a "big ream" was most successfully carried out. This in reality is the cleavage method adopted by the quarrymen in splitting the rock and wrenching it from its natural bed as it stands intact. The process adopted was as follows: About forty "pits" were scored in the top of the rock ranging from 18 to 24 inches in length, and into each of these were inserted two "pigs" of iron. Throughout the whole length of the "ream" about 170 large iron wedges were firmly driven between the "pigs" of iron. As soon as all was in readiness, forty-two men, using sledges from 12 to 14 lbs. each in weight, commenced the "battering assault." Striking simultaneously, one man to four wedges, they soon had the satisfaction of seeing the first signs of success in the shape of a very faint crack along the surface. Continuing their exertions, with occasional pauses to reset wedges, &c., they eventually succeeded in attaining their final ambition, and had completely severed the huge rock from its tenacious hold after a laborious task of 4½ hours. The measurement of the piece was 106 feet long by 20 feet wide by 12 feet deep, and is computed to contain 1,600 tons. This is believed to be the largest "ream off" in the history of quarrying operations in the island of Portland.

In addition to the prizes already offered the committee of the Cheap Cottages Exhibition will give a prize of 50% for the best cottage built of concrete or other form of Portland-cement work, and one of 50% for the best wooden cottage.

THE HYPER-ACME PULLEY.

THERE is no more useful mechanical power than the pulley. But owing to the inevitable law that a gain of force is a loss of velocity, various expedients have been devised to overcome the difficulty which is caused by weight and friction. In scientific experiments it is possible to employ a series of pulleys to produce surprising effects, and in that way weight may appear to be overcome. In business, however, any imitation of a philosophic toy is out of place. The Hyper-Acme pulley-block produces the same result we can see performed in lecture-rooms on a small scale, but more effectually and with large masses, for a lad can raise three tons and a couple of men fifteen tons by its aid. The reason is that the process of lifting has been analysed and found to have more than one difficulty against which provision is made. In lifting a weight the attention and strength are largely devoted to the endeavour to keep it from falling. The Hyper-Acme pulley, by means of a self-acting stop, sustains the load in the intervals between each exertion of force. The arrangement acts so smoothly there is no jerking or jarring, and the raising appears to the operator to be the consequence of a continuous pull. The invention is also arranged as a travelling pulley-block, and can run along the flange of an ordinary rolled girder adapted for weights up to three tons. In lowering there is no possibility of a precipitate fall. The whole arrangement is carried out with a view to hard work by Mr. Charles D. Phillips, of the Emlyn Works, Newport, Mon.

WATER-SUPPLY IN AUSTRALIA.

At the ordinary meeting of the Institution of Civil Engineers on March 28, Sir Guilford L. Molesworth, K.C.I.E., president, in the chair, the paper read was "Coolgardie Water-Supply," by Mr. C. S. R. Palmer.

The elevated tract of country situated in the interior of Western Australia, and known comprehensively as the Coolgardie Goldfields, is exceedingly arid, fresh water being unobtainable naturally, and only in small quantities by conservation, while condensed water is very expensive. The first real impetus to the progress of the colony was given by the discovery of gold at Coolgardie in 1892, and thereafter not only mining, but also the agricultural and pastoral

Hassall's Patent Water Closet.

AWARDED THE MEDAL OF THE SANITARY INSTITUTE, 1902.

IMPORTANT IMPROVEMENT IN FLUSH-DOWN W.C.'s.

SECTION.

Telephone, No. 20 Swadlincote.

ADVANTAGES.

Absolute and perfect flush guaranteed with 1½ gallons of water.

ABSOLUTELY NOISELESS.

Not depending on syphonic action.

No double trap required.

The whole surface of pan perfectly cleansed each time of flushing.

Telegraphic Address, "OUTRAM, WOODVILLE."

Excelsior and Rawdon Potteries,

C. W. OUTRAM & CO. WOODVILLE, near Burton-on-Trent.

industries rapidly increased, and it was realised that help given to the first-mentioned must also aid the latter. Large expenditure was first incurred on 'small' local water-supply works, but without commensurate results, and the Government decided on a comprehensive scheme of construction.

After inquiry into alternatives, it was recommended that the work should consist of a storage reservoir in the Darling ranges (capacity 4,600 million gallons, enough for two years supply and loss), a 30-inch pipe to carry thence 5 million gallons daily, a series of pumping stations along the pipe line and service reservoirs at various centres, the estimated cost of these works being 2,500,000/.

Parliament having approved the project and provided funds, an English commission of engineers was appointed to report on the proposals and advise on the design of the pipes, &c. Work was started soon after receipt of their report, which generally confirmed the original outline scheme. Five years afterwards, in January 1903, the works were formally opened, and they have supplied water continuously since.

The reservoir dam or weir is built across the Helena river, the height of the crest above river-bed being 110 feet, and the storage is sufficient to provide two years' consumption and loss. The catchment area is 569 square miles, but the rainfall comparatively is small and the off-flow low. The author detailed the rainfall and off-flow, and argues from the figures that percentage estimates are liable to mislead in some cases. The reservoir basin is described as badly crossed by volcanic dykes, but these are water-tight, as the small loss from the reservoir proves. Analyses are given of the water stored; they show it to be of good quality, but rather high in ammonia, higher at the reservoir than after the journey through 350 miles of pipe to the goldfields. The surplus or flood waters pass over the whole length of the dam, thus forming probably the highest overflow weir constructed; and so far no damage has occurred.

A bad fissure was found in the rock foundations of the dam when opened up, necessitating excavation to 90 feet below bed-level. The fissure was then bored into, and the watertightness of the material was tested before concreting commenced. The author describes the section of the weir, the water cushion, the valve towers and the draw-off arrange-

ments, and he states that the whole have acted satisfactorily, and that the rainfall has proved ample to satisfy the requirements.

The dam is built of concrete, and as nothing but stone was available locally a branch line of railway, $4\frac{1}{2}$ miles long, was built to convey cement, sand, &c. Water for the works and for the workmen was obtained by constructing a subsidiary weir up-stream, and the small reservoir (20 million gallons capacity) thus formed, with its overflow channel and flume, dealt with all but a few extreme floods, thereby facilitating work on the main dam. The cement used was very carefully tested, not only to insure none but good material being used, but also, as the source of supply was so far distant, to ascertain what local treatment would render good such cement as heated excessively when setting. The results of analyses and of tests of tensile strength, fineness and heating are detailed, and attention is drawn to exceptional behaviour.

The sand was all washed before use, the stone was quarried and broken locally, raw materials deposited near the mixer were worked down as much as possible by gravity, and the mixture was similarly helped in transport to the weir. Excavation of foundations was carried on night and day, an electric installation furnishing light. The concrete was spread and rammed by hand, bond being broken and plums introduced for greater cohesion and shearing resistance between layer. The concrete was built between timber frames, the mixture next the boards being worked smooth with straight spades to save rendering.

The English commissioners before mentioned were asked to report specially regarding the pipes, and the points remitted and the information furnished to them are stated by the author. The commissioners recommended that of the pipes three-fourths should be rivetted and one-fourth welded, that expansion joints should be used and the pipes be laid above ground. Tenders were invited accordingly, but permitting of alternative offers, and in the result a new form of pipe—the locking-bar pipe—was accepted, being cheaper than welded pipe and, strength for strength, than rivetted pipe. The saving on the estimate enabled thicker pipes to be used, and the danger of undetected leakage from rivetted pipes being removed, the main was laid below ground with ordinary lead joints. Analyses are furnished

of the soils along the pipe-line. For reasons given, the protective coating consisted of one part of asphalt and one part of coal-tar. The leakage from the main, both when first filled and also in regular working, was found to be small.

The author next described the locking-bar pipe, giving the relative weights and strength of steel required for plates and bars to obtain uniform strength, and he supports his opinion by the results of tests. He also explained the method of manufacturing and coating the pipes. Careful tests having shown that machine-caulked joints should prove more uniform than handwork, a machine patented locally was employed, and this, together with the method of its use, is explained. When work was in full swing as much as 35 miles of pipe per month were caulked with seven machines, at a cost no greater than that of handwork and with small resulting leakage. The sequence and method of the operations of laying and charging the main are described. No bursts occurred, but six cases occurred of pipes being cut through by the combined action of sand and water.

The friction-head allowed for in the power-calculations was for dirty pipes, and adding natural head the total lift was calculated to be 2,655 feet; but to provide for identical pumping sets, 2,700 feet, in four lifts of 450 feet and four of 225 feet, was arranged for. Results of tests of actual friction-head made on laying the main are given; also the working and reserve power, the cost of the machinery, the tests provided in the contract, and the results obtained.

These reservoirs are of concrete, and consist of six of 1 million gallons each for pump suction, two of $\frac{1}{2}$ million gallons for regulation of flow in the main, and one of 1 million, one of 2 million, and one of 12 million gallons for service purposes. Drawings are given typical of all but the last, which is of separate design. Its concrete lining is thin, unbacked, and built in sections, with expansion joints filled with bitumen between sections. A grillage of barbed wire in each section keeps it intact, and the joints are easily caulked when necessary. Normal sand being too expensive, a fine loamy sand was used for the concrete of the large service reservoir with good results. The original scheme did not provide for reticulation of townships, but this was eventually carried out at Coolgardie, Kalgoorlie, Boulder and the Kalgoorlie mining belt. A telephone line, 380 miles

long, connects headquarters, the pumping stations, and the service and regulating reservoirs with each other.

The author, who succeeded the late Mr. C. Y. O'Connor, was responsible for half the work. The original estimate, deducting the cost of work not carried out, amounted to 2,435,000*l.*, and the actual cost to 2,660,000*l.*, the excess being fully accounted for by the extra expenditure in providing high-duty pumping machinery.

WORKMEN'S COMPENSATION IN THE BRITISH COLONIES.

THE course of legislation in some of the self-governing British Colonies, in reference to Employers' Liability and Workmen's Compensation, has followed very closely the precedent of the legislation of the Mother Country.

No Colony has attempted to establish any form of compulsory insurance whether on the German model or in the form which, as has been seen, has been adopted by some countries in Europe, of freeing the employer from personal liability if and when he insures his workmen in a State-recognised association. The Colonies have followed the English precedent of imposing upon the employer an immediate personal liability for the statutory compensation, leaving him to protect himself as best he may by insurance, and providing for the claims of the workman no security (except a certain degree of preference) beyond the personal solvency of the employer.

New Zealand passed in 1900 an Act closely modelled on the English Act, but with some important variations in detail. Amending Acts were passed in 1901, 1902 and 1903.

South Australia also passed a Workmen's Compensation Act in 1900, following still more closely than the New Zealand law the precedent of the English Act. Western Australia followed in 1902 with a similar law. The Legislature of British Columbia in the same year passed an Act on the same lines.

A Bill on the same lines was introduced into the Legislature of New South Wales in 1902, but has not as yet been passed into law.

Turning now to those British Colonies which have fol-

we find that New Zealand has made considerable additions to the categories of employees who are brought under the obligations of the Act. By section 4 of the Act of 1900 the Act is made to apply to "(1) any industrial, commercial, or manufacturing work carried on by or on behalf of the employer as part of his trade or business; (2) any mining, quarrying, engineering, building, or other hazardous work carried on by or on behalf of the employer, whether as part of his trade or business or not." The main extensions effected by these words are italicised. Under these provisions it seems that all industries falling within these very wide terms are included, whether or not machinery is employed, irrespective of the number of persons employed or any restriction as to small employers; that the law extends to commercial as well as industrial undertakings, and therefore appears to include retail shops; and that an employer is made liable, whether or not the work is part of his trade or business. Coupled with the provisions of section 15, by which a person (the "principal") contracting with another (the "contractor") for the execution by the contractor of any work is liable for accidental injuries happening in the course of the execution of the work to workmen of the contractor or of any sub-contractor, it seems that under this law the person for whom and in reference to whose property any building or engineering, or other of the works above mentioned is being carried out by a contractor, is liable for all accidents happening to any of the workmen engaged in carrying out any portion of the work contracted for, without having a right of indemnity against the contractor.

The Act of 1903 extends to "contractors who contract to perform any work in any gold mine or coal mine, 'who do not either sublet the contract or employ wages-men, or who, although employing wages-men, actually perform any part of the work themselves.'"

By the Acts of South Australia and of Western Australia the obligation attaches to employment (1) "on, in or about any railway, waterwork, tramway, electric-lighting work, factory, mine, quarry or engineering or building work; (2) on or in or about any employment declared by proclamation to be dangerous or injurious to health, or to be dangerous to life or limb. Provided that no such proclamation shall issue

except pursuant to addresses from both Houses of Parliament." It will be observed that the classes of employment to which these laws directly apply are, with the exception of the specific mention of waterworks and electric-lighting work, substantially identical with the categories of the English Act of 1897; the definition of "factory" in section 2 corresponding with the extension given to the term in the English Act. Neither Act, however, follows the English Act as to the limitation of liability for accidents in the building trade by reference to the height of the building or the use of scaffolding.

The Act of British Columbia also follows closely the Act of 1897, and even adopts the building limitations, substituting, however, 40 feet for 30 as the limit of the operation of the Act.

All the three last-mentioned Acts adopt substantially the provisions of the Act of the United Kingdom with regard to the rights of workmen employed by a sub-contractor.

REGULATIONS FOR PATENTS.

THE following memorial has been addressed to the President of the Board of Trade relating to the Patents Act, 1902, and the Patents Rules, 1905:—

To the departmental committee on whose report the Act was based there was sent, in 1900, an influentially signed communication, to the following extract from which we earnestly invite your attention:—

"As, however, patents have sometimes been ultimately supported in respect of inventions which even eminent judges have regarded as not patentable, it is not advisable, in any unopposed case, that letters patent should be refused on the ground that the invention, or alleged invention . . . has been previously patented in this country, provided the applicant (if required) so amends his specification as to indicate what was previously known, thus protecting the public against being misled. Furthermore, it is not advisable either to make it publicly known that the specification has been amended at the instance of the Patent Office authorities, or to give publicity to any official notification of any kind (whether by endorsement on the specification or other-

wise) implying doubt as to the novelty of the subject-matter in respect of which letters patent are granted, because such publicity would obviously create prejudice against the patent; and, where based upon erroneous opinion, would operate unjustly."

As rules 9 and 10 now stand, however, when the Comptroller determines that reference ought to be made in the applicant's specification to a prior specification or specifications by way of notice to the public, the form of reference must be as follows, and be inserted after the claims:—

"Reference has been directed, in pursuance of section 1, subsection 6, of the Patents Act, 1902, to the following specification of Letters Patent No. ——— granted to ———."

Where the reference is inserted as the result of a provisional report under rule 7, a statement to that effect must be added to the reference.

Such a reference will virtually make public the pith of the examiner's report, notwithstanding the enactment that reports of examiners shall not in any case be published or be open to public inspection (subsection 4 of section 1 of 1902 Act, and subsection 5 of section 9 of 1883 Act, as amended by 1888 Act).

Moreover, although based upon mere opinion, which may be erroneous, it will usually render a patent commercially worthless.

This is a very serious matter, seeing that, in the past, large manufacturing concerns, which have rendered public service by introducing articles of great utility not previously on the market, besides given employment to many thousands of workmen and others, have accomplished these beneficial results under patents for inventions as to the novelty of which (in the patentable sense) expert and even judicial opinions have differed.

We therefore hope that it will be found possible to forthwith so modify the rules as to obviate the unnecessary risk they at present involve of seriously retarding the introduction of improvements which, though individually of a minor character, do, in the aggregate (to quote the Select Committee of 1872) contribute greatly to the progress of industry.

To this end we venture to suggest revision in the sense

that in no case shall either an official notification be endorsed upon or a stereotyped form of reference be inserted in an applicant's specification, unless and until he shall have been notified of the Comptroller's determination, and shall have been afforded, and shall have failed to exercise, the option of himself inserting in his own specification a reference, by number, year and name (and not in a stereotyped form) to the prior specification (or specifications), reference to which the Comptroller shall have determined ought to be made in the applicant's specification by way of notice to the public.

We submit that the Act does not provide for official insertion in, or endorsement upon, an applicant's specification of any notification; and, moreover, that, as the specification is addressed to the public, a reference in it to a prior specification or specifications, inserted by the applicant himself, would obviously constitute a notice thereof to, and would adequately protect the public, without necessarily injuring the applicant, as any official notification inevitably will.

Should it, however, be insisted that the modified procedure we recommend cannot be adopted as the law now stands, then, regard being had to the importance of the interests involved, we trust His Majesty's Government will see fit to introduce a short Bill in the coming session of Parliament, with a view of clearly legalising the proposed change in the rules.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

NOTICE.

Next Friday being Good Friday, THE ARCHITECT will be published on Thursday. All advertisements intended for this Number must reach the Office not later than 4 P.M. on Wednesday, April 19.

No alteration of advertisement copy can be allowed after Saturday morning, the 15th inst.

COMPETITIONS OPEN.

HARROGATE.—May 24.—For proposed Primitive Methodist orphanage at Harrogate. Conditions may be obtained from Rev. J. T. Barkby, Riche Mont, Harrogate.

HIGH WYCOMBE.—May 31.—Secondary school, accommodation for 175 pupils. No premium offered. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, High Wycombe.

KING'S NORTON.—April 26.—For the erection of a public library in Church Hill, King's Norton.—Architects must be resident in King's Norton or practising in Birmingham. Particulars may be obtained from Mr. A. W. Cross, surveyor, 10 Newhall Street, Birmingham.

RADCLIFFE.—April 29.—For the erection of a free public library. Premiums of 50*l.*, 30*l.* and 20*l.* will be awarded. General conditions and instructions, with an outline plan of site, may be obtained from Mr. S. Mills, clerk, Council Offices, Radcliffe, Manchester.

ROCHESTER.—May 15.—For the erection of a municipal technical institute at Rochester. Three premiums of 50, 20 and 10 guineas will be awarded. Copies of the instructions and a plan of the site can be had from Mr. W. Banks, surveyor, Guildhall, Rochester.

CONTRACTS OPEN.

ABERTILLERY.—For erection of a new Baptist chapel at Blaenau Gwent, Abertillery. Mr. N. Lewis, F.I.A.S., architect, Oak Street, Abertillery.

ALNWICK.—April 22.—For taking-down and re-erecting Little Mill bridge, for the Alnwick Rural District Council, Mr. H. W. Walton, clerk, Fenkle Street, Alnwick.

ASHTON-IN-MAKERFIELD (LANCS).—April 18.—For the erection of a new administrative building, scarlet-fever and diphtheria pavilions, laundry, disinfector, stables and mortuary buildings, and other work at existing hospital buildings, for the Ashton-in-Makerfield Urban District Council. Messrs. Heaton, Ralph & Heaton, architects, Wigan.

ASKAM-IN-FURNESS.—April 24.—For erecting a manager's house, weigh-office and other buildings at the Askam-in-Furness Gasworks. The Council Buildings, Station Road, Dalton-in-Furness.

ASKRIGG.—April 21.—For the erection of temperance hall at Askrigg (Yorks). Messrs. Clark & Moscrop, architects, Feethams, Darlington.

BARNHAM.—April 19.—For the erection of a Council school at Barnham, Sussex. Mr. F. Wheeler, architect, Bank Chambers, Carfax, Horsham.

BARROW-IN-FURNESS.—April 18.—For the erection of extensions to the electricity works, Buccleuch Street. Borough Engineer's Office.

BARROW-IN-FURNESS.—May 15.—For the construction of a steel road bridge over the Walney Channel, uniting Barrow Island and Walney Island; the bridge will consist of eight fixed girder spans and one opening span, on cylinder foundations. Sir Benjamin Baker, 2 Queen Square Place, Queen Anne's Mansions, Westminster.

BELFAST.—For the erection and completion of a block of dwelling-houses, Clowney Street, Belfast. Mr. W. J. Moore, architect, Royal Chambers, 33 Royal Avenue, Belfast.

BELFAST.—April 27.—For the erection of a library in the Oldpark Road. Messrs. Graeme-Watt & Tulloch, 77A Victoria Street.

BOSTON.—April 29.—For erection of a new infirmary, laundry, boiler-house and mortuary at the workhouse, Boston, Lincs. Mr. James Rowell, architect, Church Lane, Boston.

BRADFORD.—April 15.—For the erection of a detached house in Cleckheaton Road, Low Moor, Bradford. Messrs. Howorth & Howorth, architects, Old Bank Chambers, Cleckheaton.

BRADFORD.—April 20.—For the supply and erection of wrought-iron railing and gates at the Gillington recreation ground, Four Lane Ends, Bradford. Mr. J. H. Cox, surveyor, Town Hall, Bradford.

BRADFORD.—April 20.—For the construction of the station buildings on the line of the Nydd Valley light

railway, for the Bradford Corporation, at Pateley Bridge, Wath, Ramskill, Lofthouse. Mr. James Watson, waterworks engineer, Town Hall, Bradford.

BRIDGEND.—May 1.—For the erection of two shops and dwelling-houses at Wyndham Street, Bridgend. Mr. P. J. Thomas, architect and surveyor, Bridgend.

BRIGGSWATH.—For the erection of a villa residence in Carr Hill Lane, Briggsath, near Whitby. Mr. A. H. Young, architect and surveyor, 77 Baxtergate, Whitby.

BUBWITH.—April 15.—for alterations and additions to the Council school at Bubwith, Yorks. The Clerk of Works, Beverly.

CHEPSTOW.—April 24.—For alterations and additions to the National schools, Chepstow. Mr. W. H. Dashwood Caple, architect, Church Street Chambers, Cardiff.

CHIPPING SODBURY.—April 19.—For erection of board-room and clerk's offices at the workhouse, Yate, Chipping Sodbury. Mr. A. Roach, architect, Charfield.

COMPTON.—April 15.—For additions to All Saints Church, Compton, Hants. Messrs. John B. Colson and G. H. Kitchin, joint architects, 45 Jewry Street, Winchester.

COVENTRY.—April 17.—For erection of buildings at the Foleshill gasworks for carburetted water-gas plant. Mr. Fletcher W. Stevenson, engineer and general manager, gasworks, Coventry.

CREEGBROSE.—April 15.—For the erection of a piggery at Creegbrose, near Chacewater, in the parish of Kenwyn, Cornwall. Mr. G. Oliver, Creegbrose.

DARTMOUTH.—April 18.—For the renovation of the Dartmouth Wesleyan chapel. Mr. H. Williams, St. George's Square, Dartmouth.

DENTON.—May 1.—For two houses, Manchester Road, Denton, Lanes. Mr. Ernest Woodhouse, architect, 88 Morley Street, Manchester.

DUBLIN.—May 15.—For the erection of an electric generating station. Mr. John P. Griffiths, engineer to the Dublin Port and Docks Board, East Wall, Dublin.

DUNDALK.—April 28.—For altering and enlarging the Greenore Railway Saloon, Quay Street, Dundalk. Mr. John F. M'Gahon, architect, Roden Place, Dundalk.

increase in the takings of close upon 6 per cent. Twelve months ago the Corporation were able to hand above 52,000*l.* towards the relief of the rates, and it is stated that a still larger sum will be available for that purpose.

THE Burslem Corporation anticipate that their electrical and destructor plants will be in working order by September 1. The scheme will cost 24,000*l.* By the means of a hire purchase system customers will be enabled to pay by instalments the cost of installing electric lighting and the cost of motors. The scale of charges for electrical energy will be as follows:—For lighting, 5*d.* per unit, or at the option of the consumer, on the maximum demand system of 7*d.* per unit for the first hour each day and 2*d.* per unit afterwards. For motors, 2*d.* per unit, or, at the option of the Corporation, 10*s.* per quarter per horsepower installed and 1½*d.* per unit.

THE Secretary to the Board of Trade was asked on Monday in the House of Commons whether his attention had been drawn to the public danger caused by the laying down of exposed rails charged with high electric currents without due safeguards; and, if so, what steps he proposed to take to prevent the danger of loss of life. Mr. Bonar Law in his reply said the Board of Trade are fully alive to the dangers which may arise from this method of traction unless it is adequately safeguarded. As has been previously stated, recommendations as to the steps to be taken to prevent accidents from contact with such rails have been made from time to time to railway companies and have been adopted by them, and the matter is one that receives unremitting consideration from the inspecting officers of the department in the course of their duties.

THE consulting electrical engineer to the Brighton Corporation has prepared a report in answer to the criticisms passed on the electrical-generating station in course of erection at Southwick. Mr. Wright declares that there is not the slightest chance of the general body of ratepayers having to contribute, as the scheme can always be made as self-supporting as the Brighton undertaking has been in the past. The cost will be about 86,000*l.* less than the 400,000*l.* sanctioned. Mr. Wright points out that the electric undertaking has been self-supporting from its first year of working, that if sold it would probably realise twice as

much as it had cost and that Brighton consumes per head more electricity than any town in England. Out of net profits it has also paid 14,000*l.* in relief of the general rates.

BUILDING AND BUILDERS.

THE Duke of Westminster has promised 1,000*l.* towards the fund for building a parochial institute for the parish of St. John's, Westminster, and has given 250*l.* towards the rebuilding of the City of London Lying-in Hospital, City Road.

THE Broadwater Baptist Mission church, near Worthing, was opened on Wednesday last. The building has been carried out from designs and under the superintendence of Messrs. George Baines & R. Palmer Baines, London, W.C., by Messrs. Frank Sandell & Sons, builders, of Worthing.

THE surveyor to the Chailey Rural Council has reported that he had inspected one of Mr. Justice Grantham's cottages at Barcombe and found the drains unsatisfactory. He had interviewed Sir William Grantham, who had promised to carry out his suggestions.

THE Falkirk Dean of Guild Court on the 6th inst. passed an unusually large number of plans, several of which involved the expenditure of large sums of money. At the close of the Court Provost Christie said it was gratifying to find a large increase in the applications. He hoped that indicated that an improvement in trade had begun and would continue.

THE St. Helens education committee intend to erect new schools at Thatto Heath at a cost of 12,000*l.*, and it was decided at the Council meeting to borrow this amount and 1,050*l.*, the estimated cost of a site for another school for the Parr district. The committee also propose to erect a public elementary school for 700 scholars, and a higher elementary school for 350 scholars in College Street.

THE building interests in New York have, according to a cable in the *Glasgow Herald*, contracted for 30,000 tons of fabricated steel, and contracts with various construction companies aggregating another 15,000 tons are now pending. It is expected that the probable adjustment of the long-

pending labour war will result in a boom in the building trade. Fifteen thousand tons of steel have been sold to different railroads in the past week for building bridges.

THE surveyor at the Arundel Town Council reported at the last meeting that, although all the builders in the town had been asked to tender for the work of repairing the tidal tank of the sewage outfall no tenders had been sent in, the builders refusing to be held responsible for any accident which might occur while the work was in progress. It was decided that the surveyor, with a committee of three members of the Corporation, should carry out the work.

THE Local Government Board have issued a circular letter intimating that the King, in compliance with the resolution of the House of Commons, had ordered a return to be laid before the House, showing, as regards County and District Councils and Boards of Guardians, whether contracts for the execution of works specified any, and what, conditions as to wages to be paid by contractors to the persons employed by them, and requesting the Council to furnish a return accordingly.

THE Mersey Docks and Harbour Board at their last meeting approved of the following recommendations of the works committee:—To underpin a portion of the north wall of the Canada Dock, at an estimated cost of 8,500*l.*; to erect a single-storey shed on the north quay of the King's Dock No. 2, at an estimated cost of 31,000*l.*; and to increase, amongst other salaries, that of Mr. W. Brodie, head of the drawing and general offices, from 600*l.* to 700*l.*, and that of Mr. W. A. Ogletorpe, mechanical superintendent, from 500*l.* to 600*l.*

ON account of the serious subsidences which occurred some weeks ago in the neighbourhood of Brierley through the falling in of old pit shafts thorough search is being made in the Moor Street schools to ascertain if there was any danger of a repetition of these mishaps. A shaft has now been reached, and upon the brickwork lining of the shaft being broken through it was found that the interior was filled up. The shaft was also scooped out to some depth to determine whether the filling-up material rested on a scaffold. It was found that the shaft had been filled up all the way. A heading will now be driven to another

shaft a score yards or more away to ascertain if this also is filled up for its whole depth.

MR. J. W. BRADLEY, city engineer and surveyor for Westminster, in giving notice to occupiers and others of repaving works to be carried out by the City Council between now and October next, says that every possible provision has been made to secure that the work shall be completed with the utmost dispatch and with the creation of as little inconvenience as possible. "If at any time during the progress of the works," says Mr. Bradley, "you should think you are not receiving proper consideration at the hands of the contractor, and will communicate with me, I shall be happy to see that as little inconvenience as possible is caused to you and to the general public using the street."

MR. E. B. SAVAGE delivered a lecture on Tuesday before the Birmingham and District Clerk of Works and Building Foreman's Association, entitled "Experiences in Sewer and Drain Construction." The lecturer, on the question of the best sizes of pipes for single building, pointed out that the present tendency to use the extremely small size of 4 in. was of doubtful benefit. On the other hand, a 6 in. being somewhat too large, an intermediate, say 5 in., although not recognised as a stock size, should be pressed into service; in other words, the engineer should use the proper sizes, and no doubt manufacturers would only be too glad to supply any legitimate demand which might arise in consequence.

THERE are no more severe critics on new appliances than builders, for the task of carrying out large contracts does not ameliorate the feelings. When therefore we find so many heads of firms uniting to express satisfaction with Fishburn's labour-saving winch, there cannot be any doubt as to its merits. It is declared to be as cheap and quicker than most steam winches, to have saved a considerable amount of scaffolding, to have repaid its cost in one job, and in various other ways has gained profit for its owners, who willingly recommend it to other builders. All this must be satisfactory to Mr. Joseph Fishburn, of High Wycombe, who is the patentee, and who is in the happy position of continually receiving orders for the winch.

THOMAS LAWRENCE & SONS, BRACKNELL, BERKS.

A COMMITTEE for the relief of the unemployed in Liverpool has made an appeal for fresh funds. In alluding to the alleged boom in the building trade in the district, it is pointed out that it is largely building that does not affect the organised worker; joiners and others are imported to do the work, and when it is finished they go back home again. The larger contracts are being done by outsiders. A building, for example, at the present time is being done by a Leith firm, and men from Leith mainly employed; and for another factory the contract was let to a Stockport firm, who employed Stockport men. A large place of amusement is being erected by a Bolton firm, and Bolton men are being largely employed.

VARIETIES.

IMPROVEMENTS are to be carried out on the port of Ostend at an estimated cost of about 31,170*l*.

THE report of the Royal Commission on London's traffic is expected to be published at the end of next month.

THE borough engineer of Newport has submitted a report to the parks committee of the Corporation in favour of erecting a crematorium. The report will be considered at the next meeting of the committee.

THE Middlewich Urban Council have given their surveyor instructions to prepare plans of a sewage-disposal scheme. Application will be made to the Local Government Board for sanction to borrow 7,500*l*.

THE London County Council will consider next week a report of the housing committee recommending the expenditure of 29,000*l*. on working-class dwellings at Brixton Hill.

THE Keswick Urban District Council are to apply to the Local Government Board for a loan of 6,000*l*. for new sewage disposal works, to be in accordance with the plans and scheme of Mr. Balfour, Newcastle.

THE education committee of the Crewe Town Council asked for power to borrow 21,500*l*. for the erection of a new school. The recommendation met with considerable opposition on the score of extravagance—the cost being said to be 15*l*. per scholar—and was referred to another committee.

THE Bangor City Council have adopted a scheme of workmen's dwellings which has been under consideration for several years. The plans show forty-three houses, and the probable cost will be over 8,000*l*.

THE Colne Town Council have received the approval of the Board of Education for the plans of the proposed new school in Swan Croft, and the education committee are about to apply to the Local Government Board for sanction to the borrowing of 12,050*l*. for the building.

THE Local Government Board have informed the Louth Town Council that they decline to entertain the proposal to apply the proceeds of a sale of corporate land towards the cost of providing houses for persons of the middle class, and it was resolved that the money should be invested in Consols.

THE exhibition of carpentry and joinery and wood-carving, which will be held at Carpenters' Hall, London Wall, London, under the joint auspices of the Worshipful Companies of Carpenters and Joiners, will be opened on June 19 next, by the Right Hon. Lord Avebury, F.R.S., D.C.L., &c., who is an honorary freeman of the Carpenters' Company.

THE Walsall Town Council are making efforts to induce the Local Government Board and the County Council to agree to a postponement of the carrying out of a new sewage purification scheme, the cost of which is estimated at 80,000*l*. The reasons given are the developments at present taking place with regard to sewage purification and the fact that a Royal Commission on the subject has not yet issued its final report.

A LOCAL GOVERNMENT BOARD inquiry was recently held in Cefn, near Ruabon, in connection with a new sewerage scheme, and sanction was obtained to borrow a sum of 10,000*l*. Plans were prepared by the engineer to the Wrexham Rural District Council, tenders invited, and the tender of Mr. J. T. Jones, builder, Cefn, amounting to 9,138*l*., was accepted for the work, which will probably be commenced without delay.

THE Cretan Government propose to issue a set of stamps reproducing some of the most interesting features of the archæology of the island. The set of stamps will number nine, and will include historical scenes, ancient ruins, and

stamps from ancient coins and medals. The money imprints will include the coinage of Gortgna, Itanos and Cydonia, and there will be a medal of Ariadne. One of the ruins reproduced will be that of the Palace of Minos.

THE Admiralty have granted special permission to Captain Hickley, Mr. Phillips, Mr. J. C. Stewart and Mr. J. E. Miller, United States subjects, to visit the naval establishments and ships at Chatham. These gentlemen constitute a committee appointed by an American railway corporation to examine the principal European dockyards from an engineering standpoint, with a view to obtaining information to be used in the erection of the proposed dockyard at New Orleans.

THE Nottingham Board of Guardians have sanctioned resolutions consenting to the expenditure of a sum not exceeding 8,561*l.* in connection with the erection of the workhouse, this being in addition to the sum of 217,200*l.* and 17,627*l.* authorised by the Board in June 1902, and approving the borrowing of 9,553*l.* to defray expenditure sanctioned by the Board on September 14 and November 11, 1904, in respect of the erection of a greenhouse and pigeries. This will entirely complete the workhouse expenditure.

THE Stourbridge Guardians on the 7th inst. discussed a paragraph in the building committee's report as to tenders for stoves for certain wards. They ranged very much in figures, but only one at 38*l.* 3*s.* was stated to be according to specification of the architect. Several Guardians sharply criticised the suggestion of so much being given for stoves, or that about twenty stoves should be required for wards at all, after providing a hot-water heating system at a cost of 9,000*l.* The question was referred back to the building committee to obtain fresh tenders.

A REPLICA of the tablet which an anonymous American recently placed in the Hampstead parish church in memory of Henry Cort has been set up in the Lancaster parish church. It is of bronze, and bears a portrait in relief of "the father of the iron trade." The inscription is as follows:—"In memory of Henry Cort, born at Lancaster 1740, interred at Hampstead 1800, to whom the world is indebted for the arts of refining iron with mineral coal by puddling and rolling metals in grooved rolls."

WE have pleasure in announcing that Mr. T. H. Batstone has resigned the position held with his late firm from 1894, in order to occupy the post of managing director to the well-known and old-established firm of Hewetson, Milner & Thexton ("Hewetsons"), of Tottenham Court Road. This announcement affords a welcome opportunity for thanking those who have accorded him their patronage in the past, and who will, he trusts, continue to show their appreciation of his personal attention to their inquiries and favours.

THE Solihull District Council have decided that in future 6*s.* per "yard" (25 cwt.) should be paid to farmers for stones picked off the fields and used for the repair of the roads, provided that they would not pass through a 2½ inch gauge. The present price is 5*s.* per yard, but it was pointed out that 8*s.* 7*d.* was paid for quarry stone, which had to be carted to the roads. The proposal met with opposition. Some complained that there were almost as many oyster shells, sardine tins and broken bottles as stones in the farmers' heap of road pebbles.

A PART of the George's Dock site, Liverpool, was last week put up to auction by order of the City Council. The dock was built in 1771, but in 1900 three roads were cut, dividing it into three portions. One portion had been utilised by the Mersey Docks and Harbour Board as a site for new offices, the middle portion was reserved for the purposes of the Liverpool Corporation, and the remaining portion, containing about 6,807 square yards, with four important frontages, was offered for sale. Not a single bid was made and the site was reserved for private sale. The reserve price was not disclosed.

THE Staines Rural Council will apply to the Local Government Board for assent to a by-law permitting the erection of corrugated iron cottages. These are to contain one general room 16 feet by 13 feet, three bedrooms each 12 feet by 13 feet, and a washhouse. Such dwellings are designed for people with incomes of 18*s.* to 20*s.* per week. The surveyor stated that the cost of these buildings would be about 125*l.*, whereas if built under the present by-laws they would each cost 200*l.* The surveyor added that Mr. Justice Grantham had so frightened the Local Government Board that its assent to anything reasonable could now be easily obtained. It was suggested that the erection of these

buildings should be limited to certain areas to prevent the depreciation of property.

THE New York Senate committee make the following comments on a constitutional amendment authorising the State to issue 50,000,000 dols. road betterment bonds:—"It is believed that since the roads so improved would exist for the use of generations yet to come, it would not be unwise to cast upon them a portion of the burden of paying the debt contracted for the purpose of improving the roads. The proposed amendment is broad enough, so that if in the development of road improvement it shall seem wise to some future legislatures to pay the entire cost in the first instance of improving the roads in some poorer sections, and to permit the county and towns to repay to the State their share of the cost in partial payments, that may be done."

THE Leeds waterworks committee decided on the 30th ult. to recommend the appointment of Mr. C. G. Henzell, of Newcastle, to the office of waterworks engineer at a salary of 1,000*l.* a year. The other three remaining candidates out of seventy-five were Mr. F. W. McCulloch, Belfast; Mr. C. J. Batley, Oldham; and Mr. W. R. Barnett, Lancaster. Mr. Henzell, who is forty-two years of age, had charge of the construction of the Catcleugh reservoir for the Newcastle and Gateshead Waterworks Company. The extension scheme is estimated to cost two and a half millions sterling. The committee also recommend the acceptance of the tender of Messrs. M'Alpine & Co., of Glasgow, for the construction of Colsterdale reservoir, the tender amounting to 297,000*l.*

A COMMITTEE of the Brighton Corporation have recommended the acceptance of a private offer for the Aquarium. The Local Government Board recently refused to sanction a loan of 20,000*l.* for repairs conditional to accepting another offer. The present terms are to take the premises for thirty years at a rent of 800*l.* per annum, the Corporation putting the roofs and drains only in repair. The lessee will himself carry out the following works:—(a) The erection of a winter garden, substantially in accordance with the original plans. (b) The remodelling of the concert hall by enlarging the auditorium, lowering and widening the stage, and decorating and upholstering throughout. (c) The construction of a

new covered way from the turnstiles to the entrance of the main building. (d) The construction of a new level path from the turnstiles to the terraces.

MR. PERCY GRIFFITH, past president of the Society of Engineers, has presented to the Lincoln waterworks committee a report on the boring operations in connection with the city water supply. The period provided in the contract for the completion of the work expires on July 31, but deducting the sixteen months lost in consequence of the accident with the boring tool, the contractors will have until November 30, 1906. Judging from previous rates of progress, and assuming that no other unforeseen difficulty occurs, it is believed the boring will be completed by that date, if not earlier. The sandstone water should be tapped at a much earlier date than this; in fact, he suggested that the new supply would be obtained before the end of the present year, and should their circumstances at that time be as serious as they were at present, he had no doubt means could be devised for securing the Corporation the use of the supply pending the completion of the boring.

THE Wallasey District Council on the 8th inst. opened the school in Manor Road, Liscard. The accommodation provides for 1,148 children. Planned on the central hall principle, it comprises three complete departments, for boys, girls and infants. Each department is an entirely independent school, but the means of intercommunication are easy. The ordinary classrooms are on the ground floor, but certain special rooms have been arranged on the first floor at the north front—a science demonstration-room and practical science-room with balance-room attached. A feature of the girls' school is a specially fitted up cookery-room, also on the first floor. Ample ventilation is secured by opening casements and inlets, and the buildings are lighted throughout by electricity. It has been erected at a cost of 18,900*l.* by Messrs. W. H. Forde & Sons from the designs of Mr. Edmund Kirby.

THE Lowestoft Town Council are carrying out sea-defence works. A Local Government Board inquiry has been held into an application to borrow 850*l.* for the construction of a timber revetment at the foot of the South Cliffs. The timber revetment already constructed at the

foot of the cliff has done good work in protecting it, but it is now filled in with sand thrown over by the sea. The revetment proposed to be constructed is designed to protect the cliffs from abnormal high tides. The Local Government Board have given conditional consent, and the work was partly completed. The surveyor stated, in answer to the inspector, that the seas broke over the outer revetment at high tides, and the foot of the cliff suffered. This work was to prevent that. The length of the piles would be 13 feet 6 inches, and they would be driven in for an average 7 feet 6 inches. The old revetment was 4 feet 9 inches high above high-water ordinary spring tides, or 9 feet above ordinance datum.

We notice that the Great Central Railway Company are offering ample and admirable facilities to those desirous of spending Easter at places reached by their comfortable and picturesque route. Excursions are announced from London (Marylebone), Woolwich, Greenwich and Metropolitan stations to all the principal towns and holiday resorts in the Midlands, North of England, North-East and North-West Coast watering-places, Douglas (Isle of Man), Scotland and Ireland. The information has been concisely tabulated in the form of an A.B.C. programme giving the times of starting, fares, dates and times of return, &c., for any station (alphabetically arranged), which can be easily seen at a glance. Copies of this lucid guide can be obtained free at Marylebone Station, or any of the company's town offices or agencies. We also notice that the Great Central Company have issued an Easter souvenir card of an attractive nature depicting the harbingers of spring in the form of primroses and violets, and skilfully drawing attention to their Easter facilities, which is a distinct departure in railway advertising.

AN AMERICAN CONTRACT SYSTEM.

The various methods of paying for construction have been the subject of much discussion for many years, says the *Engineering Record*, but the latest of these to occupy a prominent place, the system of paying the actual cost plus

a fixed sum to the contractor, is comparatively novel. It was taken up by Mr. Frank B. Gilbreth, of New York and Boston, a few years ago. In 1902 a little over half his business was done in this way, while to-day all of it is on this basis. In view of the diversified character of the many large works undertaken by this builder, such as dams, power stations, shops and even complete villages, the increase in favour of the system of payment on a cost-plus-fixed-sum estimate deserves consideration.

The early system of contracting, under which the larger part of the construction undertaken to-day is carried on, was based on a lump-sum bid. In simple work of well-known character, where great speed is not required, this is probably the most satisfactory method to adopt. But as the difficulties increase the system gradually develops marked defects. Bidders cannot foresee all troubles that may arise, and they either largely increase their bids to cover these probable but unknown contingencies or else take the risk of being overwhelmed with financial disaster. Either the owner or the contractor must lose considerable money when difficult construction is undertaken on the lump-sum basis.

The second system of payment was devised to meet defects of the first method. It is the plan of paying the contractor for his services a percentage of the actual cost of construction, as shown by the books kept for the work. This frees the contractor from any bias toward skimping materials and workmanship. Where owner and contractor have confidence in each other the system is a good one, but sometimes, when the construction has proved unusually difficult and tedious, the heavy cost has caused bitter controversy between the two parties. The owner has claimed that the contractor made the work unusually expensive in order to increase his fees, while the contractor has claimed that the owner demanded impossible things.

Under the cost-plus-fixed-sum plan, which Mr. Gilbreth is now using on his work, the owner knows from the outset just what profit the contractor will make. It is not altered by deviations from the estimates of the cost, and the contractor has no incentive to produce anything but the best work. The owner can purchase the materials himself or allow the contractor to do so, the latter usually being the

better plan. Changes can be made in the plans without any objection by the contractor. When time is precious the foundations can be started before the details of the superstructure are completed. In short, the whole arrangement makes the contractor a sort of professional man, retained at a definite fee for a definite purpose. Such a system on large undertakings manifestly has much to commend it. Its merit as a preventative of controversy deserves recognition.

LONDON BUILDING ACTS AMENDMENT.

THE Building Act committee of the London County Council have prepared the following report:—

We have considered as to the course which it is advisable to take with regard to the provisions contained in the parts of the London Building Acts (Amendment) Bill, 1905, which have been withdrawn. The Council will remember that, as the result of a compromise arrived at on March 14, 1905, at the House of Commons, between the members of Parliament in charge of the London Building Acts (Amendment) Bill, and of the City of London (Escape from Fire) Bill and other opponents of the Council's Bill, it was agreed to drop all parts of the Council's Bill with the exception of Part VIII. (Means of Escape from Fire). Many of the suggested amendments which have thus been withdrawn not only affect the work of other committees of the Council, but in our opinion are quite as necessary in the public interest as those relating to escape from fire. We therefore think that the Council will desire that every effort should be made to introduce in the session of 1906 a Bill dealing with the more necessary amendments.

The Council has always welcomed suggestions or criticisms of its proposals for the amendment of the London Building Acts, and we have no doubt that it will wish that advantage should be taken of the opportunity which is afforded by the withdrawal of the majority of the suggested amendments of fully considering the views of the various bodies concerned, even though the adoption of this course may prevent us formulating our proposals in time to enable the Parliamentary committee to have all of them before the summer recess. Moreover, as many of the provisions

in the Bill introduced in the present session will form the basis of any future Bill for the amendment of the London Building Acts, and these provisions have been considered in detail by the Parliamentary committee, it appears to us that the standing orders relating to legislative proposals may be considered as not strictly applicable, or in any event that the Council would consider it a case in which, if necessary, some indulgence should be granted. The Bill which was introduced in the present session has been since the beginning of the year before the Corporation of the City of London, the Councils of the metropolitan boroughs and various professional and other bodies, but as some of the amendments are dealt with by reference to sections in the Act of 1894, it has been stated that difficulty is experienced in understanding them.

In order to remove this difficulty the Parliamentary committee, at our suggestion, gave instructions for the preparation of a document showing the effect of the Bill on the existing Acts, and we are of opinion that a copy of this document should be sent to the various bodies concerned with an intimation that the Council will be glad to consider any observations which they may wish to make on the Council's proposals, or any additional suggestions for the amendment of the London Building Acts. These observations ought, if possible, to be considered before the summer recess, and it would therefore seem desirable that the Council should fix June 10, 1905, as the last day for the submission of observations. It is hoped that all the bodies concerned will co-operate with the Council in an earnest endeavour to introduce in the next session of Parliament a Bill containing all necessary amendments to the London Building Acts. It is very probable that many persons will want a considerable number of copies of the document which was prepared by the Parliamentary committee, and we therefore propose that it should be placed on sale. We also think that a very useful purpose would be served if a memorandum on the same lines as the one which has already been sent to the members of the Council explaining in general terms the nature of the suggested amendments were sent to each member of the various bodies to whom the Bill will be sent. We recommend that, with a view to the introduction in the session of 1906 of a Bill to amend the

London Building Acts, copies of the document prepared by the Parliamentary committee showing the effect of the London Building Acts (Amendment) Bill, 1905, on the existing Acts be sent to the Corporation of the City of London, the Councils of the metropolitan boroughs, and the various professional and other bodies concerned, with an intimation that the Council would be glad to be acquainted before June 10, 1905, with any observations which they may make on the suggested amendments to the London Building Acts, and that a copy of a memorandum on the subject, to be prepared by the chairman of the Building Act committee, be sent to each member of the various bodies referred to.

TEAK GROWING IN INDIA.

THE annual report of the Bombay Forest Department, which has just been issued, deals with the administrative year 1903-4, and is therefore somewhat belated. It must be recognised, however, that exceptional difficulty probably exists in procuring forest returns. Interest in the Bombay forests largely centres in Kanara, and it is therefore natural to turn first to the report dealing with the Southern Circle. This was compiled last year by Mr. Hugh Murray, who was in charge of the Circle. Mr. Murray very rightly emphasises the great importance of the Kanara forests as being the only forests in the Bombay Presidency capable of producing timber of large scantling in any appreciable quantity. He declares that the rise in the price of imported teak in Bombay, which proceeds from a steadily increasing demand for timber, is reacting most favourably on the sales in the Southern Circle. Moreover, it is tending to stimulate the demand for the cheaper and hitherto little-used timbers of the commonest species which abound in the Kanara forests. But he accompanies this agreeable information with a serious warning. Though the present yield is still far below full possibilities, he holds that unless the question of reproduction receives more attention than it has done in the past increased exportation must lead to subsequent disaster. The divisional officers, Mr. Murray asserts, have very little time to devote themselves to sylviculture. The reasons he assigns are the undue size of the existing divisions and the overwhelming amount of commercial

business, departmental work and general protection which absorbs the attention of the officers. One of the other points he complains of is that nothing is done to increase the low proportion of teak among the present growing stock, or to extend the area of teak-producing forests. The Kanara forests are a valuable property and ought to be wisely and profitably exploited. Even as it is, the financial results in the Southern Circle appear to be very satisfactory. There is a revenue of $13\frac{1}{2}$ lakhs as against an average of about 12 lakhs during the five preceding years, and the surplus amounts to nearly $5\frac{1}{2}$ lakhs. It is gratifying to note that the improvement in the prices is held, among other things, to indicate a return of agricultural prosperity. The total number of forest offences in the Circle was 3,988, which represents a material increase. Both Mr. Murray and the Commissioner of the Southern Division agree, however, that these figures are of no practical value as an indication of the actual amount of forest crime, which is probably very much larger. It is pointed out that subordinate magistrates do not seem to be aware of the necessity of passing adequate and deterrent sentences. The Central Circle of the Presidency was worked as usual at a loss, but the balance on the wrong side has been materially reduced, and last year only amounted to 72,000 rs. Here again it is complained that magistrates do not inflict sufficiently deterrent sentences upon people brought before them for setting fire to the forests. The Northern Circle shows a surplus of over two and a quarter lakhs, being an increase of nearly a lakh as compared with the previous year. The increase appears to be mainly due to a brisker demand for timber and firewood, and was achieved in spite of the fact that expenditure was somewhat larger than usual. Mr. Atkins, the Commissioner of the Northern Division, in reviewing the report, draws special attention to the importance of tracing and maintaining fire paths through the forests. In his belief forest fires are more often due to carelessness than to malicious acts. The jungle tribes obviously cannot be prevented from smoking, and it is to the half-consumed "bidee" that many outbreaks are due. "The important thing," says Mr. Atkins, "is to prevent the fires by fire paths from spreading so rapidly during the night that the measures for extinguishing them taken at daybreak will come too late."

THE Penistone and District isolation hospital is being warmed and ventilated by means of Shorland's patent Manchester stoves and Manchester grates.

MESSRS. JOHN SMITH & SONS, Midland Clock Works, Derby, have just received an order for a large clock for Whittlesford Church, near Cambridge. It is to strike the hours, chime the quarters, and show time on one dial.

THE Kent education committee are prepared to receive designs, illustrations and specifications of fixed and movable partitions for dividing schoolrooms. Full particulars must be submitted not later than April 29 to Mr. F. W. Cook, 44 Bedford Row, London, W.C.

NEW CATALOGUE.

THE new catalogue of Messrs. C. C. Dunkerley & Co., Ltd., Manchester, suggests the remarkable variety of iron and steel sections, with girders and stanchions, which are to be found in their great warehouse in Store Street. From large-built girders to hoop-iron, the steel trade may be said to be represented in their premises, and the load upon the ground must be difficult to sustain. The catalogue gives sizes and weights and a table of safe loads, which are taken at one-fourth the breaking strain for girders and one-fifth for stanchions. It is a complete manual for those who use iron and steel and is of a convenient size.

MR. FRANK E. CAWS, of Sunderland, architect and civil engineer, died on Saturday last in his fifty-fifth year.

THE Shanghai Municipal Council have decided to inquire into the question of overhead wires with a view to ascertaining, for the information of the public, that every reasonable precaution is being observed for the protection of life in the public streets in connection with the electric tramways to be introduced there.

ELECTRIC NOTES.

THE Hammersmith Borough Council have been informed that a profit of 5,919% has been made on the past year's working of the municipal electric-light scheme.

THE Sheffield Electrical Contractors' Association attended a recent meeting of the electric-light committee of the City Council, and protested against the Corporation undertaking wiring work and furnishing fittings. It is stated the prices at which the work is done must involve the department in a loss. The committee promised to consider the specific instances mentioned by the deputation.

THE recent fatal accidents from touching the live rail not having proved a sufficient warning to prevent people from crossing the electric railway line near Southport, to their own great danger, three youths were on Monday fined 5s. and costs each for trespassing on the Lancashire and Yorkshire Railway, and the magistrates intimated that future cases would be severely dealt with.

FOR the past three years the Croydon tramways have been worked under lease from the Corporation by the British Electric Traction Company, Ltd. During the last three years of the old horse cars 10,000,000 passengers were carried, but during the three years of the electrified system 40,000,000 have been carried. In the last twelve months the population of Croydon, about 145,000, has been carried almost one hundred times over.

THE Corporation of Greenock and the tramway company have agreed on a revised scale of rates for electricity for the next five years, subject to certain conditions on the eve of settlement. The rates are as follows:—First 500,000 units at $1\frac{1}{2}d.$ per unit, next 200,000 units at $1\frac{1}{4}d.$ per unit, then 200,000 units at $1d.$, and anything further at $.85d.$ per unit. The revenue from these rates is expected to amount to about 5,000*l.* per annum.

THE Glasgow Town Council at their meeting on the 6th inst. considered the following telegram from the Mayor of Chicago:—"Chicago, the first great city in America, following the lead of Glasgow, declares for municipalisation of street cars by 25,000 majority. Will you give the manager of your municipal tramways a vacation of thirty days to visit Chicago to confer with me? All expenses, first-class

travelling and hotel bills, will be paid by me. Answer.—"The request is to be granted.

A MANIFESTO published by the Democrats in connection with the mayoral election in Chicago includes the following:—"We fully believe in municipal ownership and operation of gas plants, electric-light plants and telephone systems, and demand from the Legislature that they give the city all reasonable and necessary power to carry out this policy. And especially we ask that the present Legislature immediately authorise the city of Chicago to sell electric light to private consumers, thus enabling the city to extend its present electric-lighting plant and furnish light at a reasonable price to private consumers."

AN inquiry has been held at Norwich into an application by the Town Council for a loan of 30,000*l.* for the purposes of their electric-light undertaking. The undertaking was acquired in 1903. In the course of the inquiry Mr. H. Ross Hooper, the Local Government Board inspector, said that when the Corporation purchased they were purchasing machinery which was out of date, machines which were not economical to work. He (the Inspector) wanted to see the report on which the Corporation bought. This concern was purchased at an expenditure of nearly a quarter of a million, and it included machines which were of no value.

THE South Shields Town Council on Monday awarded the contracts for the construction of the permanent way and track of the new tramways. The total amount was 56,000*l.* The tender of Messrs. William Underwood & Brother, Dukinfield, amounting to 42,903*l.*, was accepted for the same work. The tender of the same firm for the construction of copper rail bonds and the bonding of tramways (Part 2) for 770*l.* was also accepted. The tender of Messrs. Dick, Kerr & Co., London, amounting to 2,695*l.*, for generators, of Messrs. J. & H. McLaren, of Leeds, for engines, amounting to 3,400*l.*, was accepted.

THE annual accounts of the Leeds municipal electric tramways have been presented. The number of fares paid was 64,223,666, an increase of 3,484,432 on the preceding year. Very little extra miles of lines came into use during the year, the only extensions being in a few suburbs. The receipts amount to about 295,000*l.*, or 17,000*l.* more than during the previous twelve months. There has been an

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS
COMBINING LENSES AND PRISMS.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

VOLUME LXXII. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.
Imperial Buildings, Ludgate Circus, E.C.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE
TO THE
ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO.
becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

REPLY TO LEGAL QUERIES.

DITCH (W. T. T.).—Your letter was unaccountably mislaid. You can certainly clear the ditch of the thorns, it being yours and on your land.

CONTRACT (Infant).—An infant may be restrained by injunction from committing a breach of agreement for service beneficial to himself.

MAY-OATWAY FIRE ALARM. WHAT USERS SAY.

Messrs. J. Thomasson & Sons, Spinners, of Bolton, write:—"A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily. 10 minutes before the Automatic Sprinkler went off." Loss £48. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works, Edinburgh, write:—"A fire broke out in our factory during the dinner hour on January 18, 1905, when the May-Oatway installation (put in since our previous fire) saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well." Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.C., Premier, writes:—"This system has been largely adopted in New Zealand, and has given the greatest satisfaction." (The Government are the largest users protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—"Fire March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss." Claims paid, £10 and £80 respectively. What have you done to limit your loss?

Send for circular, or call and inspect 94 Paul Street, E.C.; Glasgow, Liverpool and Manchester.

measure 20 feet by 10 feet. It is intended to display Hall's distemper, a material which is familiar to all concerned in building, as well as the Sisso white japan. The interior is fitted up as a modern drawing-room. The walls are decorated in Hall's distemper of a delicate heliotrope shade pattern No. 61 in their shade book). A picture rail, skirting and panelling show the particularly brilliant, hard and lustrous surface of their white enamel. The frieze is treated in stencil with a charming original design of tree decoration, incorporating several colours of Hall's distemper, so as to emphasise how easily this material lends itself to rapid and

effective manipulation of even the most elaborate designs in stencil work. The *tout ensemble* of the interior of the stand is a very pleasing example of that form of interior decoration which is coming so much into vogue in these days. The front elevation shows a frieze with plastered festoons distempered white on a delicate cream background. The lower walls are also covered with Hall's distemper in a delicate green shade. The wall on the left side of the stand is covered with art canvas distempered and with a landscape frieze in varied colours. The exterior woodwork is treated with Sisso white japan. The stand is ingenious and has been carried out cleverly.

Messrs. Samuel Elliott & Sons, Ltd., will display their mouldings, which are all of good contours and smoothly cut, as well as a large amount of joinery. Their work shows

that no foreign importations can surpass English productions.

Messrs. L. Lewis & Co. again bring before the eyes of the public materials of which builders have approved. Their damp-course resists pressure as well as damp; their roofing felt removes many inconveniences, and their special slaters' felt serves similar purposes under other conditions.

Messrs. H. & F. Bonten's, Ltd., collection of wrought-iron sections and mouldings is to be more numerous than is usually seen. What adds to the interest is that we can see by means of full-sized examples how they can be combined to form shop-fronts, doors, door frames, gates, including ornamented collapsible gates, railings, enclosures, brackets, scrolls, pillars, columns, girder and joist encasings, cornices, and a great variety of ornaments, &c. Students of construction will find an advantage in studying the examples, for they will enable them to realise the numerous advantages which iron offers in general construction.

In one respect the most interesting stall in the exhibition will be that of Messrs. James Austin & Sons, Ltd. For 130 years the manufacture of sash lines and other kinds of ropes used in building has been carried on by the firm. No other exhibitor in the hall can claim to retain so long a hold upon the building trade. We often hear it said that the rope-maker's craft has suffered like others, but Messrs. Austin can defy such criticism, for their products have withstood all rivalry and retain the old-fashioned tenacity of fibre.

Fashions vary in respect of paints. Sometimes a dead surface alone meets the taste of users. Of late years the preference is for an enamelled surface, which is sometimes produced by means of varnish. "Ripolin" is a paint which not only produces an enamelled surface, but one which endures, for the gloss is not of a transient kind. Its quality can be ascertained by an examination of the specimens.

The Kitchen Bath Filment Co., of 515 Queen's Road, Sheffield, will show their combination bath, sink and wash-boiler fitments. One arrangement is a bath fitted underneath a sink, the latter being of white enamelled iron secured to a hard wood frame, which lifts up when the bath is required for use. At one end is a wash boiler heated by gas, which also provides the hot water for the bath when required. Another fitment is shown in combination with

one of their patent ranges, whereby the water for the bath is heated with the ordinary kitchen fire. The bath is located underneath the sink, and when required for use turns out from one end on a pivoted and swivelled outlet. At the price these combination fittings are offered the smallest cottage need not be built without a bath. The stall is accordingly deserving of notice by all who take interest in the cottage problem.

Messrs. Barrows & Co., Ltd., of Banbury, are exhibiting an 8 nominal horse-power portable engine, a combined engine, boiler and mortar mill, a London pattern timber trolley and a 200 gallons capacity tumbler cart. The portable engine is of the makers' well-known design, having a cylinder 10 inches diameter by 13-inch stroke. The leading points claimed for it are—fewness of parts, simplicity of construction, exceptional economy of fuel and quickness in getting up steam and the lightness of draught. It is very well made; there is nothing to get out of order, and its freedom from parts and intense simplicity adapt it thoroughly for the contractor. The combined engine, boiler and mortar mill will undoubtedly be found very useful in many cases where the ordinary separate type of mill and portable engine would be out of the question. It occupies but little space, and can, therefore, be used in confined basements, &c. It can be drawn directly on to the site and set to work within an hour, and is consequently specially suited for small jobs where it is not worth the trouble and expense of fixing a separate mill and engine. The mortar pan is 6 feet diameter, of the makers' well-known under-driven type, which design they claim to be far superior to the self-delivering stationary pan, as the mortar can be taken out of a revolving pan mill in a much firmer or less sloppy state than it has to be in in order to leave a self-delivering mill, and it will be found in actual practice that a man can empty a revolving pan mill in far less time than any self-delivering mill with a pan of similar size would require to empty itself. It is fitted with hard, thick, false bottom plates in pan, heavy rollers, steel upright shaft with hardened steel toe-pieces and friction rollers under pan. The engine is of the vertical type, and so arranged as to be quite independent of the mortar mill framing, thus doing away with any chance of being thrown out of line by strains or shocks from the mill itself. The

boiler is also of the vertical type, with two cross-tubes of ample capacity to supply steam to the engine. The whole is mounted on two rolled steel joists 8 inch by 5 inch by 5 inch, connected by strong cast-iron cross-pieces, and mounted on high travelling wheels with swivelling fore-carriage. The makers claim that this machine is the most successful and most up-to-date in the market. It is, they state, exceptionally economical in fuel, and, being well designed and constructed, is capable of getting through a large amount of work. It is fitted with an extra shaft and pulley for driving a saw table or other light machine. The timber trolley is of the "London" pattern, having a body 9 feet by 4 feet 2 inches, to carry 2 tons. The wheels are fitted with patent axles. It is really a very useful trolley, and should be inspected by all builders and contractors. The tumbler cart is of 200 gallons capacity, and is provided with new improved self-balancing eccentric axle. It is specially adapted for carrying mortar or street sweepings, &c.

The *Brilliant Sign Co., Ltd.*, will have a representative collection of their letters, signs, tablets. But it is in the streets of London and of many large towns throughout this country and elsewhere that the value of the manufactures can be best appreciated. The signs can be recognised without difficulty, and they always serve the purposes for which they were intended, owing to their combination of brilliancy and definite character in the lettering.

There are other exhibitors to whose specialities we shall afterwards draw attention. But our readers will see from the foregoing remarks that the Building Trades Exhibition of 1905 will not be less interesting than those which have previously been held under the able management of Mr. H. Greville Montgomery. In our issues of April 28 and May 5 further notices will appear of the exhibition. As in former years the Proprietors of this Journal will have a particularly interesting exhibit of architects' drawings kindly lent them, which will well repay a visit. Among many other exhibits we shall refer to next week will be those of the Carron Co., Art Pavements and Decorations, Ltd., Diespeker & Co., The Adamant Co., W. Carson & Sons, Cakebread, Robey & Co., The Brilliant Sign Co., The Patent Victoria Stone Co., &c.

A SCENIC INTERIOR.

As old Chippendale furniture, with its soft brown tints relieved by greyish blue tapestries, is always suggestive of the charm and comfort of home life, it is to a house furnished in that way that Colonel Grey and his wife are supposed to return from India in Mr. J. M. Barrie's play, "Alice Sit-by-the-Fire," at the Duke of York's Theatre. The taste and judgment of Messrs. Oetzmann, of Hamp-

NEW CATALOGUES.

MESSRS. PECKETT & SONS, Atlas Locomotive Works, Bristol, have issued an abridged list of their tank engines, which are manufactured with a special view to meet such diverse needs as those of slate quarries, brickyards and contractor's work in general. The "Cranmore" class has a tractive force of 3,124 lbs., while the "Ebbw Vale" class, for the heavy work on mineral railways or mixed-traffic lines, has

"ALICE SIT-BY-THE-FIRE."—ACT I. THE HOME COMING.

stead Road, London, W., have enabled them to give a scene which shall be comfortable without ostentation and artistic without affectation. The accompanying illustration shows Act I., "The Home Coming." A similar colour scheme of brown and blue is to be found in the second act, and altogether the stage setting is both agreeable and appropriate.

a tractive force of 20,442 lbs. Messrs. Peckett find that class 474 is a favourite with contractors. The cylinders are bolted together and are inside the frames, thereby insuring steadier running. As all the moving parts, except the coupling rods, are inside, the risk of the engine being damaged through coming in contact with obstructions by the line is minimised. The tractive force is 10,626 lbs.

CROSLAND HILL STONE, HUDDERSFIELD.

Best Crosland Hill Stone, suitable for all classes of good work, specified by most leading Architects for Church Work and Public Buildings.

Can be supplied in Random Blocks for sawing into Slabs, Panels, Heads, Sills, Mullions, Cornices, or Blocks for Carving, &c.

WE SUPPLY SAWN SLABS OF CROSLAND HILL ASHLAR, in any thickness, from 1in. upwards.

Sawn and Machine Dressed Stone to customers' own dimensions, or prepared in accordance with Architects' details. Shall be pleased to quote for Quarry Dressed, Tooled, Sawn, or Machine Worked Stone of any description.

SAMPLES FREE ON APPLICATION.

GRAHAM & JESSOP, Stone Merchants and Quarry Owners, **MOLDGREEN, HUDDERSFIELD.**
Quarries at Crosland Hill and Hartley Bank, Huddersfield.
Telegrams, "QUARRY, HUDDERSFIELD." Telephone No. 211.

The engine will haul on a level 568 tons, and 165 tons up an incline of 1 in 50. The list is especially intended to be of assistance to possible purchasers. There are illustrations of fifteen different classes, each being accompanied by a brief description of the engine and of its capabilities. It was impossible to include the prices, as these are controlled by the fluctuations of the market. Messrs. Peckett state their willingness to give quotations for engines suitable for any gauge of railway or class of work, constructed for burning coal, wood, or oil as fuel, together with photographs and full specifications. They are prepared to give references to users of their engines all over the country. It is with legitimate pride that they say that more than half their orders are repeats from old customers, and many of the others are prompted by personal knowledge of the capabilities of the engine. One peculiarity of the locomotives is their compact appearance, which suggests their tractive efficiency.

The new catalogue of the Brilliant Sign Company, Ltd. (of which 50,000 copies are to be distributed), announces that "with the advent of 1905 the company have decided to supply the original and perfect brilliant letter to the trade unfixed, with explicit instructions and cements for fixing, at special reduced prices." This arrangement will no doubt extend the business, which has already attained a success which is remarkable. Business cannot dispense with announcements, and the catalogue shows them in a variety which is surprising. Fascias, projecting signs in several materials, and letters of every kind in demand can all be obtained from the company. The catalogue is a treatise on a class of work which is every year gaining in importance.

We have received two catalogues from Messrs. Peter Patrick & Son, Otley, Yorks; one for entrance and wicket gates, and the other for field gates, sheep-pens, stock bars and sundry farm requisites. The Wharfedale saw mills are fitted up with the best patent machinery and turn out articles which are eminently satisfactory. The general specification for large entrance gates is as follows:—3 inches thick, and posts for same 8 feet long by 8 inches by 8 inches; the wicket gates are 2½ inches thick, and posts 8 feet by 7 inches by 7 inches. The wicket gates are hung with

bands and crooks, not butt hinges. Ten designs of entrance gates in English oak are given, varying in price from 14/ to 7/ 15s. The same designs may be had in less expensive woods. In addition there are four separate designs for wicket gates which would be an attraction to any house. Messrs. Patrick & Son are ready to give quotations to anyone wishing for gates according to a particular design. The prices given include delivery at any railway station in the United Kingdom. The two catalogues will be of use to anyone requiring this class of goods, with sound workmanship and moderate prices.

VARIETIES.

It is proposed to rebuild six bridges at the port of Bristol at an estimated cost of 34,000/.

A COMBINATION infectious disease hospital for Berwickshire is to be erected near Gordon at a probable cost of about 4,000/.

THE villagers of Healing, in Lincolnshire, have been successful in their opposition to the proposed erection of a mill in the district at a cost of 100,000/.

AN international exhibition of milling and allied trades will be held in Paris, at the Galerie des Machines, from April 29 to June 4. Section 5 comprises lighting, heating and ventilation.

THE post of gas engineer and general manager to the Rotherham Borough Council has been awarded to Mr. J. S. Naylor, Rochdale Road Gasworks, Manchester. The salary attached is 500/ per annum.

AT Durham town hall an inquiry was held by Mr. A. A. Malet, inspector of the Local Government Board, into an application by the Corporation of Durham to borrow 18,615/ in connection with the new sewage-disposal scheme.

THE Scarborough Corporation have decided that 250 of the ordinary lights in the various streets should be converted into incandescent lights, and when this has been done practically half the lamps in the town will have incandescent lights. It is hoped that before long the whole of the 1,555 lights in the town will have been so converted.

INTERESTING TO ARCHITECTS.

The "HERMETICA" RADIATOR (Patented). For Rooms, Halls, Offices, Schools, Shops, &c. Requires no furnace and no replenishing with water. Each Radiator is self-contained. No trouble, no smell. Next to no cost for working. Railway companies use it for Waiting Rooms. The L.C.C. use it for Board Schools.

PHOTOGRAPHS TAKEN AND PROOFS DELIVERED SAME DAY. Price Lists and Estimates Free. 50,000 ARCHITECTURAL AND DECORATIVE VIEWS.
147 STRAND, LONDON, W.C. (FIRST FLOOR.)

As there will be a largely increased sale of this journal, and the advertisement space is limited, all orders for Advertisements in this Special Number should be sent by **WEDNESDAY** afternoon next to secure insertion.

THE Hampstead Borough Council borrowed 9,477*l.* from the London County Council for purposes of wood paving. The work was carried out at less cost than was anticipated, and there was a balance left of 2,135*l.* The Borough Council have decided to ask the London County Council to accept this amount in part repayment of the loan.

THE joint committee of the County Councils of Middlesex and Surrey have decided that it will be unnecessary to build a new bridge at Kingston, and that the increased traffic in consequence of the tramways crossing the Thames will be met by increasing the width of the bridge on the Surbiton side to 55 feet. As far as possible the existing characteristic features of the bridge will be retained.

THE Heywood Town Council have authorised the preparation of plans and the obtaining of tenders for 12 bacterial filters 60 feet in diameter, a sedimentation tank and an Adams lift at the sewage works, at an estimated cost of 12,000*l.* It was anticipated that there would be no increased call on the rates on account of the expenditure, as savings would be effected in other directions.

THE Northwich education authority have been informed by a firm that not only will they pay the fees of their apprentices who are to attend the day classes in technical instruction, but they guarantee the education authority against any loss in connection with the classes for two years. Employers in Mid-Cheshire have been invited to send their apprentices to the classes, which are to be held on two half-days each week.

THE law and parliamentary committee of the Westminster City Council recommend that the London County Council be informed that, as it is very doubtful whether the revolving light on the tower at the London Coliseum is a sky sign within the meaning of the London Building Act, and having regard to the fact that the County Council approved the plans and elevation before the building was erected, the City Council does not feel justified in taking any further action in the matter.

THE Edinburgh and District Water Trust have been informed by Mr. Tait, the engineer, that after the introduction of the Talla water the Trustees would cease to have the relief they had at present from the Waterworks Clauses Act to lay on a supply of water constantly at such pressure

as would make the water reach the top storey of the highest houses within the limits. In order to effect that he proposed a number of new pipings, which were estimated to cost over 25,000*l.*

THE Croydon County Council on Saturday inaugurated their first scheme under the Housing of the Working Classes Act 1890 (Part III.). Eighty-seven houses have been erected on a site of three acres, close to Woodside station. Seven acres have yet to be built on, and the purchase of five more is contemplated. Seventy-five houses are already occupied at rentals of 6*s.* 6*d.* and 7*s.* 9*d.* per week. The cost of the present portion of the scheme is about 30,000*l.*, and the annual income, with all the houses let, is estimated at 1,655*l.*

THE Anstruther Harbour Commissioners have received a reply from the Board of Trade to a memorial asking approval for the extension and improvement of the harbour at an estimated expense of 36,000*l.* The Board of Trade, among other conditions, states that the local authority must provide two-thirds of the cost and the Exchequer one-third. This was held to be an impossible condition for Anstruther to comply with, and it was resolved to ask the Board of Trade to modify it in the circumstances of the port, and of the clamant need there was for harbour extension.

THE Sheffield Corporation have appointed a committee to present a special report to the Council, as early as possible, as to the possibility of postponing certain expenditure which the Council have already sanctioned, or been asked to undertake, during the coming financial year on capital account, and as to the desirability of limiting or otherwise the borrowing of money for the repaving of existing streets, also to report on the propriety of investing the finance committee with further powers of control over all kinds of expenditure by committees, and to make such recommendations thereon as they may deem expedient.

DRAINAGE and sewage purification works were undertaken by the Town Councils of Dumfries and Maxwelltown, following upon an inquiry regarding the pollution of the river Nith held in May 1902. The towns being divided by the river, it was considered impracticable to carry out a joint purification scheme, and independent schemes on the same lines and on plans furnished by the same engineer—Mr. W. Allan Carter, C.E., Edinburgh—have been carried

out. That for Dumfries has been completed at a total cost of about 40,000*l.*, and is now in operation. The Maxwelltown works will when completed have cost 26,000*l.*

MR. HERRING, engineer to the Edinburgh and Leith Gas Commissioners, has prepared a report on the subject of public and private lighting in the city. He shows that public lamps with flat flame burner, using 2½ feet of gas per hour, with an illuminating power of 6¾ candles, cost at 2*s.* 5*d.* per 1,000 cubic feet, 21*s.* 4*d.* per burner per annum; using 2½ feet per burner per hour, giving 8½ candle-power, the cost is 23*s.* 9*d.* per annum; and 3 feet per burner, giving 13¼ candle-power, costs 28*s.* 6*d.* per annum. With incandescent lighting, a burner using 2 feet per hour, giving 50 candle-power illumination at the rate of 2*s.* per 1,000 cubic feet, would cost 15*s.* 8*d.* per burner per annum; a 3-feet burner, giving 90 candle-power, would cost 23*s.* 6*d.* per annum.

THE Derwent Valley Water Board have let four contracts for the iron pipes to be used for the conveyance of water to the districts to be supplied, the first and second of these contracts having been entrusted to the Staveley Coal and Iron Company, Ltd. Contract No. 1 is for about 9,000 tons of pipes, 45-inch, 27-inch and 24-inch diameter; and contract No. 2 is for 10,000 tons, chiefly 45-inch diameter, and all 12 feet long. Contract No. 3, which was for about 12,500 tons of 45-inch pipes, was secured by the Stanton Iron Company; while contract No. 4, which has just been given out, and is by far the largest of the whole, comprises no less than 31,000 tons of varied diameters, the Staveley Company being given as their proportion about 25,000 tons of the larger sizes, and the Sheepbridge Company some 6,000 tons of the smaller ones.

A BILL has been submitted for the approval of the United States Congress which provides for an annual license fee of 25 *dols.* for a master builder, who must secure his license by passing an examination before a board to be composed of two architects in active practice, two master builders, and the inspector of buildings of the district or his assistant. Each applicant shall pay 10 *dols.*, such fee to be used for the expenses of the board. Under the proposed Bill a master builder, before receiving a license, will be required to file a bond for the proper per-

formance of all work. It will be unlawful, if the Bill passes, for any unlicensed person to engage in the work of constructing or reconstructing buildings, or knowingly to employ an unlicensed person for such work. It is said that the purpose of the Bill is not to interfere in any way with minor repairs by carpenters.

THE Austrian Consul-General at Rio de Janeiro remarks in a recent report that in consequence of the enlargement and improvement of the harbour of Rio de Janeiro, the works of demolition connected therewith and the reconstruction of a number of streets, there is a large demand for iron and steel girders, cement and other materials used in building. The construction of the new docks necessitates the erection of a large number of extensive warehouses, and, moreover, hundreds of modern houses will be built in place of the old buildings. These works will soon be commenced, and although iron and steel girders have not hitherto been made use of, yet it is probable that in the new buildings these will supersede the old-fashioned wooden materials. The Consul-General adds that harbour works and various improvements are projected in other towns in Brazil, some quarters of which are about to be entirely modernised.

ELECTRIC NOTES.

THE sum of 2,750*l.* has been promised by the Southport electricity committee in aid of the rates, as compared with 2,500*l.* last year.

A LOCAL GOVERNMENT BOARD inquiry has been held at Sunderland into the Corporation's application for sanction to borrow 15,000*l.* for purposes of electric lighting and 9,585*l.* for street and bridge improvement. There was no opposition.

THE electric-light committee of the Southwark Borough Council received an offer from a private company to supply electric current for public street lighting at the rate of 2*d.* per unit. On the recommendation of the committee the Council decided to take no action in the matter.

THE Dunfermline Town Council have been recommended by Mr. Cohen, consulting electrical engineer, London, that they should enter into an agreement for a

period not exceeding five years with the Fife Electric Power Company to give a supply of electricity in bulk. It is pointed out that on expiry of the agreement the Corporation could erect a generating station if it were found that the light had been largely taken advantage of.

LEITH Town Council will have to relay the section of the tramways system from the foot of Leith Walk to Pilrig at an estimated cost of 3,000*l*. This section was relaid about four years ago at a cost of several thousand pounds, and it was hoped that the heavy rails then laid would suffice for the new system now being installed. The rails were banded for electricity, iron connections being placed between the two rails at intervals. It is now found, however, that the part of the rails on the inner side of the groove is much worn.

THE Dalkeith Town Council have sent the draft agreement concerning the proposed tramway service to the Suburban Electric Tramways, Ltd. The Council propose to retain the power to control the Sunday traffic. The proposed conditions include one that the company shall, within one year from the date of the passing of the provisional order, substantially commence the work of laying down the tramways, and within two years have the same open for the conveyance of passengers. There is a limitation that the fares shall not exceed one penny per mile, and that on workmen's cars the charge shall not be above half that rate.

BUILDING AND BUILDERS.

THE Rotherham Borough Council have approved of the plans prepared by the Corporation architect for the erection of lock-up shops with offices over the same, and for the reconstruction of the market shops and shambles at an estimated cost of 17,249*l*.

THE contract for the erection of a new Cotton Exchange in Oldhall Street, Liverpool, was on Saturday signed with the Waring-White Building Company, London. The amount was 133,000*l*, this being the lowest tender. The building is to be completed within eighteen months. The architects are Messrs. Matear & Simon, Century Buildings, North John Street, Liverpool.

THE attention of municipal authorities and consumers is called to the fact that there is reason to suspect that certain quantities of the so-called natural Portland cement from abroad have been sent out in bags bearing the names of one or other of the Irish cement works.

IN the course of extensive alterations at Panton Hall, near Market Rasen, while a number of men were hauling a roll of lead, weighing about half a ton, to the top of the building, the rope broke. The lead fell on some steps, which were demolished, and the workmen, some of whom were on the steps, had miraculous escapes, some of them receiving slight injuries.

THE Metropolitan Water Board on the 14th inst. decided that tenders be invited for the completion of the Staines reservoirs communication works in the New River district at an estimated cost of 152,400*l*. The scheme comprises an aqueduct, reservoirs and pumping machinery at Kempton, a pumping station at Cricklewood, and a reservoir at Fortis Green, the expenditure incurred up to the present amounting to nearly a million. The complete scheme was estimated to cost 1,270,000*l*, but it has been modified by reducing the size of the Fortis Green reservoir.

CARDIFF master builders have met the employees in conference in reference to the notice of the masters for a reduction of wages and an alteration of hours. The masters at the beginning of the winter gave six months' notice, in accordance with the rules, to terminate the present agreement as to wages and hours, and the notice expires on May 1. Unless the parties arrive at an agreement before that time a general lock-out will ensue. The masters ask for a reduction of $\frac{1}{2}$ d. per hour in the wages and a certain alteration in the working hours during the winter months.

AT the Liverpool Labour Council a complaint was made that joiners, painters and labourers' work had been and was still being done in connection with volunteer drill sheds by army instructors. Reference was made to one particular shed where whitewashing, painting, glass repairing and woodwork was said to have been done by instructors during the winter. These kinds of jobs have previously been done by tradesmen, generally some connected with the corps. It was resolved to write the commanding officer

PHOTOGRAPHS TAKEN IN ANY PART OF THE COUNTRY AT A FEW HOURS' NOTICE.

of the corps mentioned protesting against such work being done by other than authorised tradesmen; and it was further decided that, if necessary, a similar communication be sent to the officer commanding the north-western district.

MR. ARNOLD-FORSTER has stated that it has not been decided to abolish the system of triennial contracts for repairs altogether, but it is the intention in those cases in which the work can be done satisfactorily and efficiently to replace the present triennial contract system by the employment of day labour. It is understood that this plan has been adopted by the Admiralty with success. Instructions have been issued to the various general officers commanding, requesting them to inquire and report whether the conditions of the various divisions of their commands are suitable for the adoption of the new method.

On Saturday, at Hammersmith, an inquest took place on the body of an employé of the Hammersmith Town Council. On February 16 the deceased and four others were engaged at the municipal electricity works loading a van with empty cable drums. The drums, which weighed several hundredweights, were rolled up some planks. There was no crane or hoist for the men to use, and one of the drums slipped and rolled on deceased. He was taken to the West London Hospital with fracture of the spine, and remained there till his death. The jury returned a verdict of "Accidental death," and added a rider that they considered the Borough Council should have provided proper appliances and sufficient men to load the drums.

ECONOMICAL BUILDINGS IN LIVERPOOL.

A novel experiment in house building, to which we have made frequent reference, has just been made in Liverpool, and if this prove satisfactory there is every reason to believe, says the *Liverpool Courier*, that the financial cloud which has ever darkened the prospect of housing reform will be removed.

It is by the ingenuity of the city engineer (Mr. John A. Brodie) that the road to the solution of the problem has been opened, and his novel and enterprising scheme has reached its consummation chiefly by his sagacity and zeal and the loyal assistance of his staff. The scheme was for

the erection of concrete cottages upon a principle never before attempted. It was probably the latter fact which led to such a stern opposition being raised to the proposal. Despite extraordinary difficulties which were bound to arise in the carrying out of such a novel project, the work has been accomplished, and to-day a block of buildings unique in design and in method of construction stands in Eldon Street, a monument to the presiding genius at the city engineering department.

The building, which is three-storeyed, has been constructed out of material which in the ordinary course of events would probably have been deposited at the bottom of the sea. Clinkers compose the constituent part of the building material. In the first instance, the clinkers were crushed and mixed with a proper proportion of cement. The solution was then filled into huge moulds, and slabs were formed representing a complete wall, floor, or roof of a room. The openings for doors, windows, &c., as well as fireplaces and flues, were made in the slabs, which when matured weighed in some cases 11 tons. These slabs were moulded at one of the refuse destructor depôts and conveyed a distance of two miles to the site. The spectacle of the wall of a room standing upright upon a waggon and being dragged by a traction engine through the streets naturally aroused the public curiosity, and consequently there has been an extraordinary interest evinced in the building operations at Eldon Street. A huge travelling crane has been employed to place the slabs in their different positions, and the care and precautions observed in handling such heavy and cumbersome things may be judged from the fact that not a single accident has occurred. The slabs or walls were first secured together with bolts, then dovetailed and finally cemented. A steel frame has been embedded in the slabs, which have been placed under severe tests and proved sound. The entire work of erection was carried out within six months. The building wears an attractive appearance and presents a remarkable contrast to the adjoining property. But apart from mere attractiveness the tenements are of a perfectly sanitary character, and in every way most suitable for the accommodation of the poorest people of the city. There has been an early demand for the tenements, all of which will be occupied at once.

The main object in view, having provided a healthy place of abode for the poor, is to secure a return in rents to cover the interest and sinking fund on the money borrowed. It is estimated that there will be a 5 per cent. return on the capital expenditure, which would, no doubt, be regarded as eminently satisfactory.

CHICAGO'S FREIGHT SUBWAYS.

IN 1899 the Illinois Telegraph and Telephone Company began to build a series of tunnels under the streets of Chicago for the purpose of carrying the wires and cables of the company's automatic telephone system. This network of tunnels is now utilised, says the *Scientific American*, for a quite different purpose than that for which it was originally constructed. This further use is as a system of electric traction for the handling of freight, express and mail. The company, now incorporated under the name of the Illinois Tunnel Company, was granted a franchise for this purpose in July 1903. It is controlled by the leading railroads which enter Chicago. Something of the immense importance of this undertaking to Chicago will be gleaned from the following account. Perhaps similar systems of tunnels will some day be built in other American cities.

The great advantage of a system of freight haulage of this kind is apparent at a glance. Far below the surface of Chicago's streets scores of electric locomotives are pulling freight-trains that are taking thousands of tons of coal into the boiler-rooms of skyscrapers, without dirt, noise or sign of effort in the street. They are removing tons of ashes, and caring for the excavations from the basements of buildings in course of construction. More than this, they are hauling daily many thousands of tons of freight which was formerly carried over the pavements in waggons. On February 15, 1905, the company entered into a contract with the Government under which all of Chicago's second, third and fourth-class mail matter will be transferred from the railway stations to the new post office through the tunnels. A further plan to utilise the tunnels for mail purposes involves the building of chutes connecting the street-corner mail boxes with boxes in the tunnel, where

the mail can be collected by cars. When the new schemes are perfected and added to the present pneumatic tube service for first-class mail, Chicago will have the most perfect underground mail facilities in the world. Eight hundred and eighty tons of mail will be handled in the tunnels daily in special locked United States cars. The system will be in operation by June 1.

Without noise, dirt, smoke, or the slightest delay to traffic, the central business district of Chicago has been honeycombed with these tunnels. Twenty-eight miles already have been constructed and extensions are projected.

Fourteen per cent. of the railway mileage of the world centres in Chicago, and operates to and from a business district $1\frac{1}{2}$ miles square. This is the territory of the freight subways. In it are thirty-eight railway stations, and every working day more than 112,000 tons of freight are moved to and from them. This situation has caused great congestion in the streets, and this the subways have met and relieved. The cars of the tunnel company are run directly into the railway freight-houses, loaded, and run through the tunnels to the consignees. Here the cars are run into the basement of the warehouse through an opening cut in the masonry, raised to the desired floor on elevators and unloaded. If the goods are not intended for immediate delivery, the cars are run into the company's storehouses and kept there till required. Every building on the route of the tunnel can be connected to it by a lateral shaft for the above purpose.

The work on the telephone tunnels was planned in 1899, but did not actually begin until September 1901. It was found that the space below the paving was almost completely taken up by water and gas-pipes, sewers and the conduits of other companies. After investigation of the soil underlying Chicago, it was decided to build a deep-tunnel conduit system, as this could be done without danger to adjoining property or without interfering with other corporation rights. After considerable difficulty in securing the final municipal permit to construct the system as planned—in fact, numerous alterations were necessary—and in making an accurate survey of the streets, the company was at length allowed to begin work on the undertaking. The trunk line tunnels were to be 12 feet 9 inches by 14 feet and the branch tunnels 6 feet by 7 feet 6 inches.

The work was carried on almost entirely in firm clay, which was encountered about 19 feet below the street grade. The pneumatic system was used more for protection against labour troubles than for other reasons, for should the workmen go out on strike, there would be no damage if the work were left for a time in an uncompleted state. The airlocks, placed just outside the seven shafts, had iron doors embedded in concrete, and were long enough to accommodate the work, in some cases as many as ten cars being in a lock at once.

The work was carried on by miners working in three shifts of eight hours each, the nature of the soil permitting the work to be done in this way. The distance excavated averaged about 21 feet at each of fourteen working headings, and 12 miles of tunnels were virtually completed in about ten and a half months.

The concrete was placed in the bottom of the excavation and thoroughly tamped, the lagging placed on top of the concrete, iron ribs made of channel bars being placed on the bottom 3 feet apart and the lagging laid at the sides against these ribs. The concrete was then thrown behind the 2-inch plank lagging in 6-inch layers. The use of concrete absolutely avoided any chance of settlement of the earth, as it was tamped into the entire space between the lagging and the excavation, no matter how irregularly the digging or mining had been done. For part of the work steel lagging plates were used as a special precaution, on account of the extra weight of the concrete. In proceeding with the work the face of the preceding day's work was cleaned and a plaster coating of cement, made in proportions of one to one, sand and cement, was plastered on the old work, forming a seal and making the structure almost entirely a homogeneous one. The 6 by 7½ lateral tunnels were constructed with 13-inch bottoms and 10-inch walls of concrete. The trunk system tunnels were built with 21-inch bottoms and 18-inch walls. The cement used for the making of the concrete was American Portland (Atlas and Chicago A.A.), and the company subjected each and every barrel to a fourteen-day test under rigid specifications. On the straight work mixtures of five parts broken stone and screenings, or five parts mixed gravel and sand to one part of cement were used, while at the intersections

a mixture of four parts stone or gravel to one of cement was adopted.

A large equipment of small tramcars, some 900 in number, built to run on a 14-inch gauge, double-track system, was provided to dispose of the excavated material. The cars were hoisted by power-driven elevators up the shafts to the head-houses and the material dumped into waggons. Much of this was deposited on the lake front, a special 10-ton, stiff-leg derrick being provided for unloading the waggons. In this way much valuable land was added to Grant Park. At one shaft near the river an endless chain drew the cars up an incline on to stagings or platforms extending over dumped scows moored to the dock below, and the cars were then emptied into these. The platforms could be raised and lowered as required, so as not to interfere with the river traffic.

The steepest grade in the tunnels is 1.75 per cent. and the grades at the railway terminals do not exceed 12 per cent. The latter steep grades form the approaches to the tunnels, which are built with the rails some 30 feet below the street level. The four-way intersections have curves of 20-foot radius, and the sharpest curves on the main lines are of 16-foot radius.

The track is 2-foot gauge, laid with 56-lbs. T-rails fastened by bolted clamps to cast-iron chairs embedded in the concrete floor of the tunnel. Part of the system is overhead trolley, while the rest is of the Morgan third-rail traction system. This latter consists of a perforated metal plate (½ inch thick and 4 inches wide) forming a rack which is bolted between two lines of timber stringers. These serve to protect and support the rail. A special construction for the tunnel work was devised in the use of chairs of bent steel channels to support the rack. The locomotives are of the class used in mine haulage work, but are peculiar in the method of taking current. The rack rail serves both for traction and as a third-rail conductor, the current being led to motors, geared to the axles, with suitable controlling devices. The track rails are used for the return current. The wheel base of the locomotives is 24½ inches. With one 75-horse-power motor the weight is about 3 tons; with two 80-horse-power motors about 5 tons. The trolley locomotives are of the ordinary type used in mine systems.

THE BUILDING TRADES EXHIBITION.

THE Exhibition of the Building Trades in the Agricultural Hall at Islington will be opened on Thursday next, the 27th inst., by the Right Hon. Lord Windsor, First Commissioner of Works, and as at the present moment there is a decided improvement in the Building Trades, it is being run at a very opportune moment. Among the numerous shows which are held in succession in the hall there can be no question about which is the most important. As Ruskin says:—"Every man has at some time in his life interest in building," and in no other class of work is there such a combination of science and art. In international exhibitions building may appear to lose some of its interest, and indeed it is a common opinion that from Hyde Park in 1851 to St. Louis in 1904 construction was inadequately represented. The building exhibitions at Islington compensate to some extent for the shortcomings of those enterprises which are supposed to be world-wide in extent.

At the present time the exhibition has a peculiar interest. The unsettled state of the world during late years has had the effect of raising an obstacle to legitimate speculation. In some places the investments in building have diminished in amount. But one of the results has been that manufacturers have endeavoured to surpass themselves, and this fact will be exemplified in many sections of the approaching exhibition. It is not possible to have improvements in materials which are supplied by nature, but in artificial compounds which are intended to rival them, greater strength and endurance have been attained. The additional experience gained, for instance, has not been lost on the *Columbian Fireproofing Co., Ltd.*, and their concrete floors and peculiar system of girders will be deserving of attention from architects.

Unfortunately the by-laws which are enforced in English towns are not favourable to construction in concrete, the material which is now receiving most attention on the Continent and in America. If the authorities were more just towards invention we might expect to have a larger area of the hall occupied with illustrations of systems which would promote safety and economy. But in spite of the indif-

ference there is still a wide field in which by-laws are inoperative. The *New Expanded Metal Co., Ltd.*, are able to produce floors and partitions, and their stall will show how far armoured concrete can be employed for the interiors of buildings. It will be a practical demonstration of the system. The stall will be a light steel-framed structure, about 16 feet by 16 feet on plan, with a suspended expanded steel and concrete floor 3 feet off the ground, and a suspended ceiling 9 feet above the floor, with roofing over that. The floor has two spans of 8 feet by 16 feet long, one span being completed flooring and the other flooring in progress showing the method of construction. The ceiling will exemplify different applications of their lathing, and with regard to the roof, on one side will be some roofing in situ, and on the other some expanded metal and concrete slabs on R.S.J. purlins about 4 feet apart. There will be also included partitions and walling upon the framework, both hollow and solid, to show the company's different systems, and some encased steel-work for the same purpose. Expanded steel and concrete steps will be placed up to the floor, and a wood-framed door and sash will be fixed into the walling, and work in as various systems and details as possible will be presented so as to make the exhibit instructive to the trade. In the forecourt will be exhibited goods made up with iron bar and expanded metal, such as fencing, tree-guards, lockers, baskets, builders' screens, riddles, &c.

At present the *London Fireproof Platewall Co., Ltd.*, confine operations to partitions which are used not only in public offices in London but for borough councils, so that their work is in keeping with the by-laws. The company claim that the partitions are fireproof, sound-proof and vermin-proof, and cost less than lath and plaster.

Messrs. Hodkin & Jones, Ltd., of Sheffield and London, will exhibit their corrugated-bar system of fire-resisting floors, which they claim are cheaper and stronger than other existing forms. Two pieces of flooring are to be shown; one being 8 inches thick, having 6-inch corrugated bars embedded, and the other piece of flooring 6 inches thick, having corrugated bars 4 inches deep. The object of this form of bar is to eliminate all flanges,

which are the chief cause of longitudinal cracks, common to fireproof floors.

The *Fireproof Co., Ltd.*, 10 York Buildings, W.C., are showing a well-appointed exhibit of the various kinds of work to which their specialité of dovetail corrugated sheeting, &c., may be applied. Among the work it is intended to illustrate may be mentioned the London County Council fireproof staircase enclosures, fireproof lift enclosures, both of which can be finished at 3 inches in thickness, and suspended ceilings of shallow section dovetail corrugated sheeting. The latter is used as a permanent centring to concrete floors, thereby avoiding all use of wood centring, so that all work in the building can be carried on without interruption while the concreting is in progress. The exhibit also shows the utility of the sheeting for forming straight partitions, ordinary divisions to rooms finishing at 2 inches in thickness, and being fire, sound, damp and vermin-proof, the nature of the sheeting allowing practically any kind of plastic material to be used with same. For irregular work with sharp returns, panelling, &c., the sheeting is admirably adapted. For curved work, girder and stanchion casings, &c., it is by reason of its peculiar form of construction most suitable. The illustration will suggest the character of the exhibit. Complete buildings with or without steel framework have from time to time been erected upon this system, the interior and exterior walls being plastered to a total thickness, in most cases, of not

exceeding 2 and 3 inches, sand and cement being used as the outside covering to the sheeting, and being finished in

such manner as desired by the client, either rough-cast, pebble-dash, hand-floated or lined to represent masonry.

The *Havelock Patent Plaster Partition Company*, of 63 Finsbury Pavement, E.C., will have a unique demonstration of the rigidity and lightness of the patent partitions they are showing. A large piece of partition about 14 feet by 8 feet will be shown carrying itself by lateral pressure on the two sides, and is unsupported either at the top or bottom. This is achieved by the blocks being so constructed as to tenon into one another. These partitions have been used at St. James's Palace and other important buildings.

According to the opinion of some admirers concrete seems likely to supersede stone. That change will never take place in England—at least until our quarries are exhausted. The stone trade, it is to be hoped, will be properly represented. Among the varieties which are coming into favour is Weldon stone, which is one of the

lower oolites. Specimens are to be exhibited by *Mr. John Rooke*, and it is well to remember that stone of the same formation was used in the cathedrals of Peterborough and Ely. *St. Dunstan's*, in Fleet Street, is a more familiar example. What can be done with a mineral substance under new conditions is to be seen in the adamantine clinker of *Messrs. Towers & Williamson*, which is invaluable for use in stables.

Messrs. Stanley Bros., Ltd., have brought glazing to perfection, and bricks of different and suitable colours will be shown.

Messrs. Tucker & Son, Ltd., Loughborough, are to exhibit bricks of various sizes and forms, which have been found especially useful in sanitary works.

An impetus has been given to the manufacture of tiles by the latest styles of domestic architecture. All householders do not, however, approve of the change from slates. However well they look on a sunny day, many varieties of tiles are disposed to slip, and the absence of one spoils a roof. *Messrs. Colthurst & Symons*, of Bridgwater, overcome that difficulty by their patent tiles, which are so held together they can resist storms.

Poole might be supposed to be distant from the centre of the fictile industry. But the Romans, who were not wanting in shrewdness, worked beds of potters' clay in the district. It is hardly necessary to say that *Messrs. Carter & Co.* have demonstrated that the beds are not exhausted, for their tiles, mosaic and faience, are known in other countries besides England. At Islington they will show an ambitious work, viz. an alcove in grey terra-cotta with seats, and within an elaborate fireplace in glazed faience (dark green), shown below with a panel in slipwork which appropriately displays the arms of the borough of Poole. A terra-cotta plinth borders the stand, at the corners of which fine vases are placed. Stands showing some of their latest wall-tiling are set on a floor of tiles and mosaic, thus in small space exemplifying the chief products of the firm.

"Opalite" has been "one of the most successful of modern inventions." We understand that about 250,000

square yards have been fixed in London alone. Yet it was only introduced about ten years ago. "Opalite" is a strong tile or plate having a rough granulated backing (*Shelmerdine's patent*) fluxed into the material at the time of manufacture, thus insuring a secure key for fixing to any structure. It has been very largely used in hospitals, mortuaries, bath-rooms, &c., in fact, all places where cleanliness and light are of first importance. Its close joint and highly-polished surface also preclude the secretion of any fungi or vermin. It is also possible to execute any design in "Opalite," and examples of dadoes will be seen which have been produced by *Mr. William Griffiths*, who is the London concessionaire.

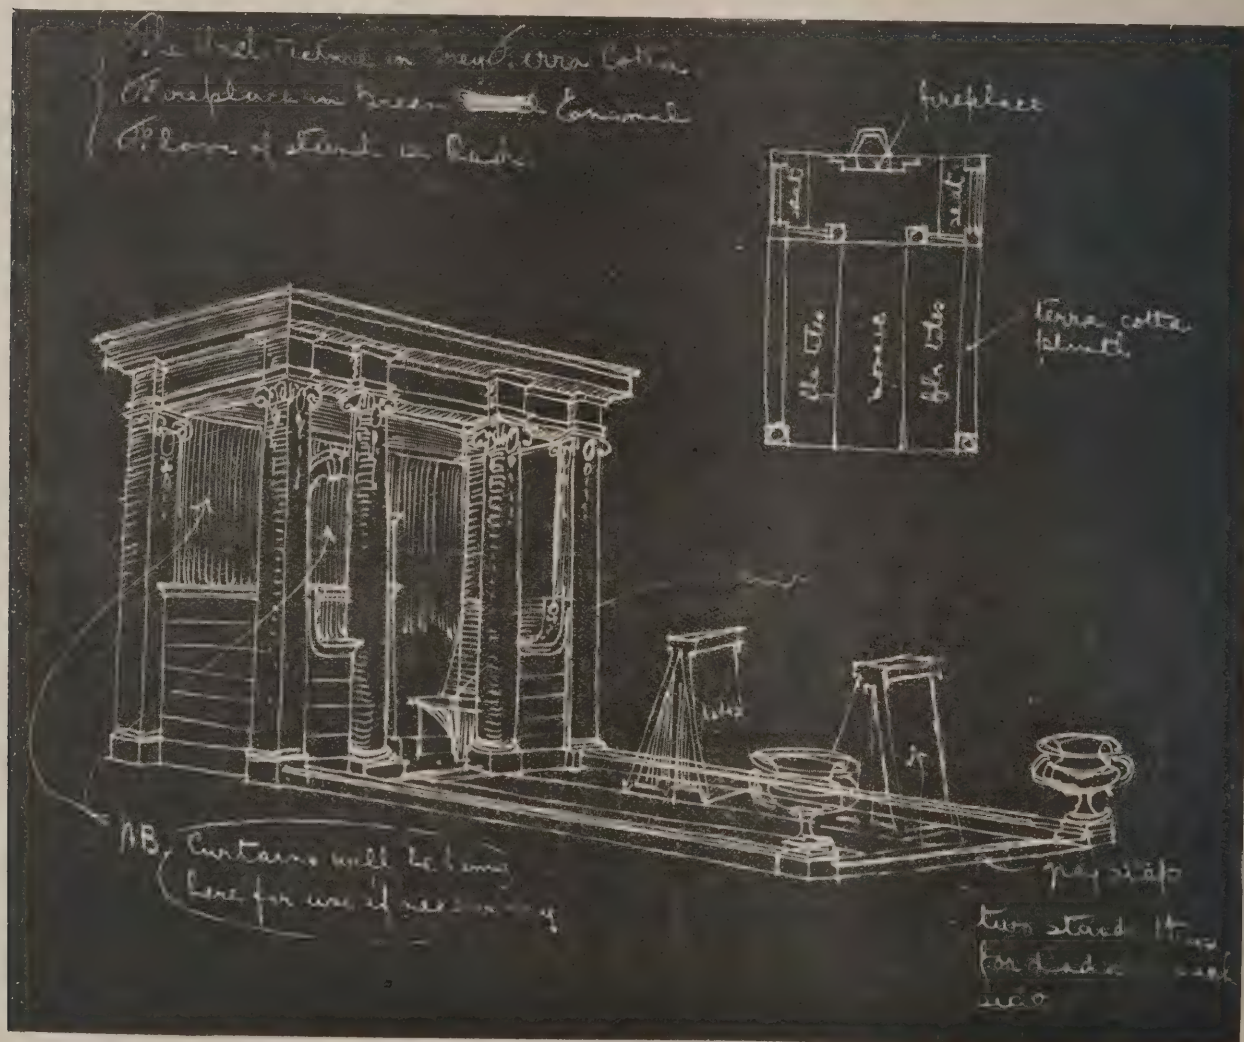

The *Mosaic Manufacturing Co.* do not confine themselves to one variety; marble mosaic as well as glass and gold mosaic and work with ceramic tesserae can be seen at their stand. The specimens are effective, and as an English company they merit encouragement.

Another English manufacture which by its intrinsic merits has worked itself into general favour is *Cloisonné Glass*, which is produced at a cheap rate. The designs are in a refined style, and the material is adapted both for transparent and subdued lights.

Messrs. Bratt, Colbran & Co. are known as the patentees of the "Heaped" and "Valley" firegrates, which are found to be auxiliaries in affording protection against fire. But in addition to the fireplaces they make all accessories, whether mantels, tile-linings or hearthstones. They are also known for well-designed door furniture. Their stall may consequently be considered as up to date, and it will show interesting works in wood and metal.

The collection of timbers by *Messrs. William Oliver & Sons, Ltd.*, suggests the extent of their business. All the woods used in construction or decoration can be supplied by them. Practically their stall serves as a museum of timber, and thus helps in affording instruction to the general public.

The stand of *Messrs. Sissons Bros. & Co., Ltd.*, must attract the attention of the most casual visitor, for it will

THE
Architect and Contract Reporter.

IMPORTANT NOTICE
TO THE
ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO.
becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.
No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.
Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

HARROGATE.—May 24.—For proposed Primitive Methodist orphanage at Harrogate. Conditions may be obtained from Rev. J. T. Barkby, Riche Mont, Harrogate.

HIGH WYCOMBE.—May 31.—Secondary school, accommodation for 175 pupils. No premium offered. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, High Wycombe.

RADCLIFFE.—April 29.—For the erection of a free public library. Premiums of 50*l.*, 30*l.* and 20*l.* will be awarded. General conditions and instructions, with an outline plan of site, may be obtained from Mr. S. Mills, clerk, Council Offices, Radcliffe, Manchester.

ROCHESTER.—May 15.—For the erection of a municipal technical institute at Rochester. Three premiums of 50, 20 and 10 guineas will be awarded. Copies of the instructions and a plan of the site can be had from Mr. W. Banks, surveyor, Guildhall, Rochester.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—May 2.—For disinfecter house, mortuary and making macadam roads on the site of isolated hospital at Hartshead. Mr. J. Lowe, sanitary surveyor, Health Department, Town Hall Chambers.

BARKISLAND.—May 5.—For the erection of a villa residence, boundary walls, &c., at Barkisland, Yorks. Mr. C. H. Petty, architect, 12 Waterhouse Street, Halifax.

BARNSTABLE.—April 29.—For alterations to the fire brigade station. The Borough Surveyor, Barnstable.

BARROW-IN-FURNESS.—May 15.—For the construction of a steel road bridge over the Walney Channel, uniting Barrow Island and Walney Island; the bridge will consist of eight fixed girder spans and one opening span, on cylinder foundations. Sir Benjamin Baker, 2 Queen Square Place, Queen Anne's Mansions, Westminster.

BARRY.—May 1.—For the erection of a new girls' school to accommodate 398, together with a caretaker's house, cookery kitchen, and manual instruction-room, at High Street, for the Barry Urban District Council. Mr. G. A. Birkenhead, architect, Caledonian Chambers, Cardiff, and 101 Holton Road, Barry. Mr. T. B. Tordoff, clerk, Barry.

GILBERT WOOD & CO. LTD. Imperial Buildings, Ludgate Circus, E.C.

WHILE a labourer was at work in a recently emptied brick-kiln at Peterborough the arch gave way and the man was buried in the fall of hot bricks. His groans guided the rescuers, and after five minutes exertion he was uncovered. His arms were severely burnt. His body was blistered and turned all over through the contact with the bricks, and there is no doubt that had he not been extricated when he was he would have been literally baked alive. It was expected that he would recover.

ONE of the largest steel firms in South Staffordshire has announced that they have just booked orders for two years forward. The contracts include plates, angles, T's, large bars and miscellaneous sections for engineers, structural engineers and similar heavy consumers. The prices at which these orders have been booked are an advance upon anything that has prevailed since the spring of last year, and further advances are anticipated with confidence. Girders and plates have risen to 5/ 15s. to 6/ 10s. boiler plates to 6/ 15s. and 7/ 5s., and angles to 5/ 10s.

THE Brighton Town Council have adopted a recommendation by the resident electrical engineer suggesting the appointment of an architect in connection with the premises proposed to be erected in Bread Street. It was resolved that Mr. Thomas Garrett, of 30 Ship Street, should be engaged as architect to prepare plans and specification, and to superintend the construction of the new buildings, at a remuneration of 5 per cent. on the cost of the work, such remuneration to be inclusive of all architect's services and out of pocket expenses, except the preparation of quantities.

THE new church for the Royal Marine Artillery at Eastney, the foundation-stone of which was laid on March 16, 1904, is now on the point of completion. The work of the contractors for the fabric has been finished. The remaining minor details are being carried out by the works department under the superintending engineer of Portsmouth Dockyard. These consist of the carving of the capitals of the pillars, the instalment of electric lighting, the fitting up of the organ and the placing of the seats.

REPRESENTATIVES of masters and men in the New York building trades at a meeting on the 22nd inst. signed an agreement to refer their differences to arbitration. About

100,000 men and 1,000 masters were represented. The frequent disputes in the building trades have delayed many New York improvements for years. Owing to the unsettled conditions and the uncertainty as to the period in which buildings could be finished, work that would otherwise have been started has been postponed. It is expected that a result of the settlement will be a building boom.

VARIETIES.

AN American firm has contracted with the Japanese Government to build a complete steel plant at Kuri at a cost of 1,250,000 dollars.

THE Darlington Corporation are seeking permission to spend another 50,000/ on the extension of the municipal gasworks. These and the waterworks provide revenue that relieves the rates to the extent of nearly 2s. in the £.

THE gas committee of the Manchester Corporation out of their profits for the past year will contribute 50,000/ for the relief of the rates, while the tramways will contribute 46,000/.

ON Friday, May 26, at three o'clock, the new buildings of the City of London College, in connection with the scheme of commercial education, will be opened. These buildings have been acquired at a cost of about 30,000/.

AN international competition for prizes offered by the Association of Italian Manufacturers for the Prevention of Accidents in Factories is to be held during the Milan Exhibition of next year. The prizes consist of six gold medals and 9,500 lire.

THE Camelford Rural District Council are asking county councils throughout the country to support a petition to the Local Government Board to approach Parliament for powers to permit rural district councils to sell or let pieces of roadside waste land for building or any other purpose.

PENGE was transferred from the London County Council area to Kent some years ago. The London County Council claimed from Penge the sum of close upon 80,000/. An inquiry took place at Spring Gardens about two months ago. According to the award just announced, Penge has to receive from the Council a sum of nearly 5,000/.

8 BRADFORD AVENUE, LONDON, E.C.

THE Local Government Board have refused to sanction the borrowing of money by the Runcorn Urban District Council to enable them to connect their waterworks with the Vyrnwy mains of the Liverpool Corporation. The Local Government Board state that a provisional order must be obtained, and this will entail a delay of eighteen months in carrying out the scheme.

THE Birmingham education committee have adopted the report of the technical education and evening schools sub-committee, which recommended the establishment at the municipal technical school of a course of instruction in practical sanitation, together with the formation of a Sanitary Board to supervise such teaching. It was stated that in Birmingham and round about there were 120 sanitary authorities.

THE Aberdeen Town Council at their last meeting discussed at length whether Jarrah wood blocks should be laid in St. Nicholas Street instead of 4-inch granite cubes. The tramways and streets and roads committee recommended that the thoroughfare be laid with granite cubes. This report was adopted by a large majority.

THE Local Government Board have sanctioned the application made by the Foleshill Rural Council for a loan of 22,000*l.* on account of Bedworth sewerage scheme, and it was decided to apply to the Public Works Loans Commissioners for that amount. The plans by Mr. T. F. Tickner, architect, for a hospital for infectious diseases other than smallpox were approved, and it was decided to ask the Local Government Board's permission to borrow for the purpose 9,250*l.*

FIGURES have been collected showing the number of accidents arising in the construction of the Simplon tunnel. Since 1898, when the work was commenced, thirty-nine persons have lost their lives, including the engineer, Signor Bianco, and two other officials, who were killed in the tunnel on February 24 last. The accidents to workmen have totalled no less than 5,536, many of which, however, were of a minor character. Twenty-eight were of a very grave nature, entailing life-long disablement. There were no epidemics of disease during the whole time of the work, and in consequence the deaths from disease were very few in number.

THE seventh session of the International Railway Congress will open at Washington on May 4, when about 1,500 railway men will meet to discuss matters relating to the administration of railways. Delegates will arrive in New York on or about April 29. The delegates will afterwards proceed to Washington, where they will be received by the President. The Congress will sit from May 4 to May 14, after which a grand tour of inspection covering 2,600 miles will be made, and the following cities and places will be visited:—Altoona, Pittsburg, Cincinnati, St. Louis, Chicago, Buffalo (including Niagara Falls), Schenectady, Montreal, Boston, &c. The tour closes at New York on May 30.

LIÈGE EXHIBITION.—On and after the 1st proximo the service by the Harwich route between London and Liège will be greatly accelerated. Passengers leaving Liverpool Street station at 8.40 P.M. will be due at Liège at noon the following day. Dining and breakfast cars will be attached to the boat trains between Liverpool Street station and Parkeston Quay, Harwich. By this service passengers are enabled to enjoy a night's rest and breakfast on the steamer before landing at Antwerp. Through carriages will run from alongside the steamer to Liège and *vice versa*. The Great Eastern Railway Company have also arranged for cheap return tickets available for seven days in connection with the Exhibition, which will enable passengers to break their journey at Brussels.

THE Scarborough Town Council have received the report of a consulting engineer as to the damage sustained by the Marine Drive, at the foot of Castle Hill, in the storm of January last. Mr. James Walker (engineer to the Tyne Commissioners) recommends remedial works with the utmost possible expedition, as owing to the blows of the sea, the pressure of water at the back and the absence of support at the toe the structure has been so severely shaken that it is in the first stage of disintegration. Unless it is strengthened in a thoroughly satisfactory manner another severe storm may cause a breach. The damaged portion, Mr. Walker points out, is roughly 540 yards in extent, and he suggests the construction against the front of this section of three concrete-in-mass buttresses, 83 feet, 95 feet and 228 feet in length, at an estimated cost of 8,000*l.*

THE BUILDING TRADES EXHIBITION.

ANYONE who looked on the Building Exhibition at noon on Wednesday would hardly be able to recognise how much trouble was necessary in order to make all the stalls appear complete. He might be excused if he thought that chaos had come again. Everything appeared to be in disorder, and as each set of workmen were compelled to labour in a restricted space it seemed as if a completion would never be reached. Superficial observers may not realise how much skill is required in order to make a building exhibition appear to be perfect. Building, and of a delicate kind too, has to be executed with many of the structures. All the parts must fit perfectly or it will be supposed that the materials are unshapely. Allowance is rarely made for the difficulties which accompany the erection of these small structures. Columns, arches, partitions, flooring, all have to be put together with expedition and yet to present the appearance of careful and systematic labour.

On such occasions the difference between English and foreign workmen becomes plain. One becomes excited by the novel circumstances, the other is as cool as if arranging shows in a hurry were his everyday occupation. In elaborateness we believe the present Exhibition to surpass its predecessors, but everything was in its place when Lord Windsor arrived to take his part in the opening ceremony.

Lord Windsor, in rising to declare the Exhibition open, said that if any proof were necessary of the undoubted success, importance and usefulness of the Building Trades Exhibition it could not be better found than in the ever-increasing number of exhibitors. In 1895 they numbered ninety-two, and during the last five biennial exhibitions the number has been consistently mounting up, until in 1905 the total is 317. This result likewise demonstrates that the manufacturers of the industries allied to the building trade find it worth their while to place their inventions and improvements before the public. And, furthermore, that it is becoming more worth while for visitors to come. Lord Windsor laid stress on the subject of smoke abatement, in connection with which there is a special exhibit. In the past the question has been neglected, and more especially in this country, whether in London or the chief

manufacturing provincial cities. In London the smoke nuisance is almost unbearable when it manifests itself in visitations of yellow fogs and killing vegetation. Smoke has a disastrous effect on building stone, necessitating the renovation or renewal of old stonework. The aid of chemists in warring against the evil by means of preservatives is not to be despised, but it is far better to secure a prevention than a cure. An even more vital question to everyone in the present day is fire prevention. It is impossible for a large body of men to aggregate without serious danger from this evil. But vast strides have been made within the past few years, and they may be seen and realised by an inspection of many of the exhibits dealing with the danger. We have to recognise the constantly altering methods of building which are effected by the discovery of new materials. The streets of London exemplify this fact well. It is the duty of the architect to use these advantages properly and with a regard to truth. No one can be quite happy in the contemplation of a jerry-built house, and yet cheap construction is a necessity. To strike the happy medium must be the goal of every architect and every builder.

Mr. Fitzroy Doll, Mayor of Holborn, proposed a vote of thanks to Lord Windsor. He said he did so more especially as a member of the great profession of architects—perhaps the greatest of all professions—the profession that has supplied man's earliest wants and still continues indispensable to the human race. Lord Windsor was, in his opinion, deserving of sympathy in his official capacity. The Board of Works are the victims of a disastrous economy. The House of Commons seemed incapable of realising the actual material advantages arising out of the existence of fine buildings. Paris has not made this error, and now enjoys the profits. Eleven million pounds are spent by travellers in Italy, who are attracted by the architectural glories and their associations.

Mr. Greville Montgomery, in seconding the vote of thanks, alluded with conscious pride to the success of the Building Trades Exhibition. For the first time in the history of the Exhibition the entire building was absolutely

full of exhibitors, every one of them being connected with the trade. When he (Mr. Montgomery) commenced his connection with the show some ten years ago the display was most miscellaneous, and included shooting galleries and sweetstuff stalls.

Lord Windsor, in returning thanks, read an apology from Sir Aston Webb, R.A., who was unable to fulfil his promise to attend owing to a Council meeting of the Royal Academy. Lord Windsor expressed his pleasure in attending not only in his official capacity, but as one who had taken a life-long interest in architecture and its allied arts and industries.

The stand of the *Patent Victoria Stone* is to be found in the gallery. To the initiated it may be said to be a compendium of building under new conditions. There is a bungalow which is constructed with the slabs, and which, besides possessing sanitary conditions, has the stability that is essential. Cottages constructed in that way would be a boon in country districts. The company also show two varieties of their paving slabs, which are familiar to pedestrians in towns all over the country. Then we see staircases with rectilinear and curved treads. It is needless to say that by the material the most difficult problems in such work can be overcome. The balustrading is of admirable design, and a part is laid out on a curved plan to show the facility with which all arrangements can be met. There are some elaborately carved columns and panels, vases which may be called elegant, and much else which is worth attention. There is a fine pilaster, and as a rival some Gothic panelling of excellent style. Altogether the combination will suggest the capabilities of Victoria stone.

The *Carron Company* will be certain to attract general attention by their comprehensive display, which ranges from three stable stalls to boiling pans. If all their specialties appeared they would occupy the entire hall. No one should fail to see their grates in the seventeenth-century style. The originals were executed at Carron Works from 1780 to 1800. Since that time the designs were so greatly admired by architects and other experts visiting the works that the company decided to reproduce the old examples. With this object the services of Mr. John

Kinross, an architect whose authority is undoubted, were secured, and he arranged the design. The success which resulted has been beyond doubt, and for an ocular demonstration we would point to the "Shrine" and the "Bacchanalian" grates. The first is suitable for a boudoir or study and the other for a small dining-room. The "Radiant" fires show all the most modern improvements. The bottom grate is concave in shape and has a movable front bar or trivet. The bar is removed from the vertical to the horizontal as soon as combustion has set in, thereby allowing the heat to be uninterruptedly diffused. The designs are artistic and the "Radiant" grate is of a very ornamental character. The other exhibits of the Carron Company include cooking-ranges, stoves, portable ranges, chimneypieces, firedogs, &c. In an age of iron and steel the Carron Company hold a position which is unquestioned.

We referred last week to the *Columbian Fireproofing Company* as likely to show some of the effects which additional experience has produced in dealing with their material. One of their specialties is a section of a circular drain in concrete and metal which all sanitary engineers should carefully consider. The diameter is about 5 feet and the thickness is 3 inches. The surface is as smooth as a perfect casting in fine metal. It would be difficult in cast-iron to obtain as satisfactory a section with such uniformity of thickness, for everyone knows that with large castings there is a risk that, although the specified weight per yard can be assured, uniformity of thickness cannot be guaranteed; an excess of metal may be found in one part with a corresponding diminution in another. The pipe is an undoubted *tour de force*. The method of arranging the steel armour around is shown. Another object which is also important is an arrangement in concrete to serve for linings of Mansard roofs. They are not always easy to construct, and we may add that when in position they do not always appear to correspond with the original design, for optical allowances must be made which are not always easy to determine. By the *Columbian Company's* method the conditions of a Mansard roof can be realised, and by the adoption of their system the risk of fire is so minimised as to appear almost trifling. The girders and other metalwork employed are also exhibited.

St. Mary's Church, Linslade, Bucks.

Works have been carried out under the direction of the late Sir ARTHUR W. BLOMFIELD, A.R.A., J. L. PEARSON, Esq., R.A., F.S.A., Messrs. BOOTH & CHADWICK, Manchester, and other eminent Architects.

The pavilion of *Ripolin, Ltd.*, is a model of good taste. It is in the Adam style with delicate columns, medallions, ornament and mouldings. It would be admired by Paris decorators. The whole is covered with Ripolin in various tones, all being equally soft and restful to the eye. The enamel on the columns is so fine as to suggest mechanical polishing, but it is simply brushwork and an excellent medium. The pavilion is so successful it merits preservation.

The specimens of W. Duffy's patent system of doweled paving in Jarrah and other woods are shown in the three stalls of the *Acme Flooring Company*. The blocks of D quality are prepared from the finest timber, thoroughly seasoned and rift sawn, so that only the fine grain of the wood is to the wearing surface. Particular attention is paid to insure freedom from knots and that there shall be no sap. In addition to the D quality two others, only slightly inferior, may be obtained. The roadways laid by the company for the Tower Bridge in 1895 are still in perfect preservation. The London School Board employed the "immovable Acme system" for fourteen years, and the present education authority have continued to do so. Not a single one of the 9,000,000 blocks supplied in 330 schools and extensions have been rejected. The blocks will wear through to the dowel and beyond it. We might mention that not more than eighty blocks are required for each 100 yards super.

There have been many attempts to prevent the rain coming through roofs, rotting the timber supports, penetrating any plaster covering and falling into the room beneath. *Watson's Patent Fluted-Faced Tile* is well adapted to achieve this object. The fluting insures the equal distribution of rain over the tile as well as channels for its downflow. The ridges are about 2 inches above the bottom edges of the upper tile. In case of a roof abutting against a wall the fluted tiles form an admirable key for cement filleting. The fluting is more than utilitarian, for it is decorative as well. Vertical tiles for gabling may be had in many patterns from the manufacturer, Mr. Charles Watson, Napton-on-Hill, near Rugby.

The *Hard York Non-slip Stone Company* this year exemplify how a pavement that usually is monotonous in colour may be varied. In addition to their flags of a

natural grey tone they show flags which are coloured, and a sufficient area has been laid down to suggest the effect. The perfection to which the system has been carried is seen in their "non-slip mosaic flags," which are adapted for corridors. In order to indicate the strength and tractability of the ordinary non-slip flag, a number of carvings have been made. Various samples are shown of steps and landings. As a further test non-slip mouldings have been used in the decoration of the stall.

Messrs. Brookes, Ltd., of Halifax, show their blue and grey Ystehede granite, which can be polished, picked and fine axed, and is well adapted from the uniformity of grain for ashlar. From its strength it can be used as setts for tram lines and for kerbs. Specimens are also exhibited of Swedish, Irish, Welsh and English granite, and Norwegian dock copings. *Messrs. Brookes, Ltd.*, possess estates in Scandinavia, and they illustrate by photographs the process employed in preparing the stone. The Silix brand stone has been employed for the new public offices in Westminster. The Silix stone of the firm has been in use for many years.

Messrs. J. A. King & Co. can claim an analogy with nature for their "Mack" patent fireproof and soundproof slabs and blocks. By using strong hollow reeds they are able to form air cells, which not only diminish the weight of the partitions, which is often an advantage to prevent the passage of sound. In Buckingham Palace cockle-shells were employed to prevent the passing of sound, because in those days concrete was not used for partitions. The strength of the slabs has been tested up to 6½ cwt. per superficial foot, and a slab has been tested in a fire, which was increased to 2,000 degrees Fahr. without the fire passing through it. No metal of any kind being used in the manufacture or in the erection of "Mack" slabs, the partitions cannot lose their strength. Neither is there anything to discolour the plastering.

A liberal education in the number of uses to which marble is now put is afforded by the extensive exhibit of the *Art Pavements and Decorations, Ltd.*, which occupies six bays in the gallery. Each stall illustrates some particular department of their business. A novel feature is the Medmenham tiles, which were produced under the direction of Mr. Conrad Dressler, the sculptor. A new paving

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS
COMBINING LENSES AND PRISMS.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

MAXIMUM LIGHT GLASS . . .

Is supplied in sheets for glazing like ordinary window glass.

Also in ornamental patterns glazed in lead.
And in crystal tiles framed in copper.

VOLUME LXXII. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.
Imperial Buildings, Ludgate Circus, E.C.

material is seen in Petroglass, which is harder than granite, unaffected by acids or oils, and has been proved to resist a current of 10,000 volts. The extent of the selection now available to users is seen in the display of 160 small slabs of different marbles. A conspicuous feature of a noteworthy exhibit is a slab of Greek cippolino, standing over 10 feet in height, and of beautiful colouring. It may be noted that these marbles are taken from the stock-rooms of the firm, and are not specimens specially obtained for display. A very effective combination of wood and marble is shown in a chimney-piece. Marble pavements are seen in various designs, as well as mosaic work. The parquet and joinery is on a level with the other exhibits of the firm, and this is high praise indeed.

An exhibit of an eminently utilitarian character is that of the *Preston Granite Concrete Company, Ltd.*, Preston. They show their granite concrete slabs, which form a most enduring pavement. The slabs are capable of standing a pressure of 600 tons on each. The thickness varies. In Lancashire, for instance, the wear and tear is such that a thickness of 2½ inches is usually specified. Chiefly owing to the substitution of boots in the place of clogs in the south of England the thickness required is only 2 inches. The firm are in the fortunate and unique position of being able to ship direct on board the boats in the Preston docks. This advantage has a most material effect on the price they can quote. The firm are about to send 30,000 yards of their paving for Capetown, which is, we believe, the first contract of its kind to be secured by an English firm.

Two traceried windows on each side of the stall occupied by the *Empire Stone Company* will be sufficient to arrest the attention of passers-by. Another architectural feature is a couple of Tuscan columns similar to those to be used in the Society Buildings, Birmingham. The stone is shown in various colours and resembles Portland stone, red or yellow Mansfield. Two different examples of steps are shown, as well as samples of flagging.

Among the many original features exhibited by *Messrs. Stavers & Stavers* is their machine-grained door, which would deceive anyone not initiated into the secret. There are about forty other deal doors shown, and every one is according to an original design, well repaying the avowed endeavour of this firm to leave behind old-fashioned ideas

and to strike out on new lines. The workmanship is of a very high quality and excellent finish. One door is fitted with composition panels, which may be picked out in colours, thus giving a striking effect. Several different porch fronts are shown with great effect. Builders' joinery in all its requirements is provided by *Messrs. Stavers & Stavers*, 158 Leadenhall Street, E.C.

Eubœolith Patent Flooring is a plastic material which may be laid *in situ* on concrete, old wood floors, flagstones, &c. It is fireproof, and being a solid, jointless mass affords no possibility of the accumulation of dirt or bacteria. It is therefore especially adaptable for hospitals of all kinds. The company have found that in this description of work a hollow skirting all in one with the floor is advantageous. But hospitals are only one of the many varieties of buildings where *Eubœolith* is employed. Others are schools, halls, barracks, factories, workshops, &c. Mr. J. Percy Day, 3 Victoria Street, Westminster, will supply any information.

Art and permanence might be taken as a motto by the manufacturers of *Durolite*. They are artists and painters in stained glass and in other forms, and they wish that the beautiful tiles which they produce should be of a character which will endure. The tiles are of exceeding toughness, for they can be struck by a hammer without fracture. They are also lined with a material which is an impediment to the spread of fire. Whether the tiles are plain or ornamented they are alike enduring, and a wall lined with them is not liable to the unsightly appearance which is sometimes caused by ordinary wear and tear, and sometimes by the disregard of people. Several varieties are to be seen lining the stand of the manufacturers, who also show examples of stained glass and of an application of photography in the form of landscapes and portraits which is remarkable. All the contents will bear rigorous examination.

We hesitate about referring to *The Architect* stand, but it deserves notice as an example of expeditious construction. It is mainly constructed of Kent slab plates and wooden framing. The material is possessed of many invaluable qualities, but it should also be added that in emergencies it lends itself to the occasion, and when painted a pleasing structure is obtained at a moderate cost.

INTERESTING TO ARCHITECTS.

The "**HERMETICA**" RADIATOR (Patented). For Rooms, Halls, Offices, Schools, Shops, &c. Requires no furnace and no replenishing with water. Each Radiator is self-contained. No trouble, no smell. Next to no cost for working. Railway companies use it for Waiting Rooms. The L.C.C. use it for Board Schools.

THE WINGET CONCRETE BUILDING-BLOCK MACHINE.

THE varied possibilities of concrete as a building material are becoming more and more widely recognised. At the present juncture such a contrivance as the Winget concrete building-block machine is of an eminently useful character. It possesses many noteworthy features. The concrete blocks can be made for an 8-inch or an 18-inch wall with equal ease, and of any shape. They may be rock-faced, cut, sawed, chiselled, brush-hammered, panelled, plain or highly ornamental faced by merely attaching the proper wing-faced plates made in accordance with the desired architectural design. The mechanism which can accomplish so much is of wonderful simplicity. It forms the mould, relieves the block, and removes the cores automatically by merely revolving the gear attachments. Two seconds are sufficient to form the mould, and in three seconds the block is ready to be relieved. Nevertheless, they have all clean, hard and sharp corners, making solid, closed and lasting joints. The variety of forms obtainable is remarkable. The blocks may be made solid with oval or hexagonal openings, with recesses for the admission of the ends of joists, with flues from top to bottom; circular, having different degrees of radius, 45 deg. angle blocks for use in bay windows, or a special plate permits of the turning out of caps and sills up to 48 inches long. Messrs. H. J. Stoddart & Co., 144 Bath Street, Glasgow, are the general sales agents for this machine in Great Britain and Ireland.

TRADE NOTES.

THE new sanatorium, Blackpool, is being warmed and ventilated by means of Shorland's patent Manchester grates, exhaust roof ventilators and special inlet ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE two blocks we give herewith illustrate the main feature of Cooley's patent system of double dowelling wood-block flooring. The effort has been to improve on the

existing methods of combining wood blocks. This is done, as will be observed, by their patent pin. The two main shanks of the pin are forced into the blocks. In addition to the grip thus obtained the joint is strengthened

by the two projections which are turned at their ends in different ways, and again entering the block form a double dowel. The pins may be inserted in any part of the blocks. The flooring is rendered so immovable that no adhesive composition is required. In case of dampness a thin coat of composition may be laid. Every floor laid down in accordance with this system is accompanied by a guarantee for six years. The blocks may be had in two qualities, the woods in general use being yellow deal, pitch pine or oak, and the timber is thoroughly seasoned before use.

MANCHESTER WATERWORKS.

NEARLY six miles of new iron piping have been laid on renewals account during the past year, 14½ miles of iron piping have been laid in extensions in various townships, and connections have been made to 5,975 additional houses and other premises by means of over 5¼ miles of service piping at an expense of 1,667*l.* 1*s.* 11*d.* The 36-inch main from the Prestwich reservoirs for the distribution of water from Thirlmere has been completed, and the new arrangements in connection with the supply of water to the township of Salford came into force with the quarter ended March last.

THE MOMENTUM ENGINE (Patented). The Discovery of Mechanically-made Power.

NOW IN OPERATION AT THE ALEXANDRA PALACE, LONDON, N.

THE discovery; that, a free racing Flywheel possesses two natures, under one—it will receive rotary motion for the application of twenty pounds—notwithstanding it weighs a ton, and the second nature of the Flywheel is, that when it is connected to a working load it will throw out the rotary value of the centres of the weights in motion, by the square of the velocity, the centre of Gyration.

This discovery means several great Flywheels, each separately driven by any motive power, each Flywheel taking its regular turn to revolve a working shaft, to which it is connected, and from which it is disconnected for a greater length of time. Radium, and also these Engines, prove that the Theory of Energy is false. This Engine can be seen running the electric light at the Alexandra Palace. It is explained free.

The Engine has taken a first-class Diploma of Merit at the Alexandra Palace for Electric Lighting.

The report adds:—The reservoirs, watercourses and other works at Longdendale have been maintained in an efficient condition. The offices and workshops at Bottoms, which had been in use many years, have been rebuilt, the old material being made available as far as possible. The scheme which has been devised for utilising the flow of compensation water for generating electricity for lighting, supplying power at the workshops and working the private railway up the valley has also been completed, and is working satisfactorily. The Thirlmere works have also been maintained in a satisfactory condition. Considerable improvements have been made by the Cumberland County Council, with the co-operation of the committee, in the roads and bridges at Thirlmere, which will prove of great advantage to the waterworks estate. The drainage of Shoulthwaite Moss, which has been contemplated for some time, is also being proceeded with. The works for the raising of the lake were so far completed in March last as to allow of water being impounded to the new level of 15 feet above that to which the lake was first raised. The second line of pipes throughout its entire length of about 45½ miles has continued to work very satisfactorily. Some little work in connection with the trimming-up of the surface of the land, roads and other small matters remains to be done. The amounts paid to the contractors during the year have been:—Messrs. Fisher & Le Fanu, 28,010*l.*; Messrs. Monk & Newell, 16,850*l.* The final statements of the work done under these contracts are now being prepared. The contracts for valves, bridges and sundry ironwork are practically completed, 8,355*l.* having been paid on account of these during the year. The work of lining the aqueduct at Hutton Roof has had to be suspended during a portion of the year, but the same will be again proceeded with as soon as possible.

The demand for hydraulic power has been steadily maintained during the year. The plant already installed is utilised to within 10 per cent. of its maximum capacity, and the committee have at present under consideration the question of the erection of an additional pumping station. Connections have been made to eighteen additional premises, containing sixty-four machines. The total number of premises into which the supply is now introduced is 496, and the total number of machines connected is 1,839. The

total length of hydraulic mains laid is 20 miles and 461 yards, of which 669 yards have been laid during the year.

PREVENTION OF LEAD POISONING.

THE medical officer of health to the Chesterfield Rural District Council in his last report says:—Several cases of lead poisoning were reported to me during the year, and I found on examination that they were genuine ones. The fact that the water as supplied in house services will take up lead, though it shows no acidity when tested with lacmoid solution, points to the necessity of further treatment than the passing of it through lime filters, or the addition of Paris white to the water in the reservoirs. No doubt these measures do some good, but the water should be rendered slightly alkaline by the adoption of some such system as is used at Redmires or the addition of sodium carbonate as at the Wakefield Corporation Waterworks. In the supplement to the thirtieth annual report of the medical officer of the Local Government Board, Dr. Houston writes respecting the last:—"Five hundred gallons of a strong solution of soda (about 1 lb. per gallon) are mixed with one million gallons of acid water. The result is very satisfactory, as the water after treatment no longer acts on lead and is slightly more than neutralised. As regards erosion of lead, it may be added that while the 'untreated' water possesses strong erosive ability, the 'treated' water is not only cured in this respect, but is placed, as it were, in a state remote from the possession of erosive ability. No other form of 'treatment' appears to confer this property on water in an equal degree."

MR. GEORGE ADAM HART, of Birmingham, has been recommended by the sewerage committee of the Leeds Corporation for appointment as sewage engineer at a salary of 1,000*l.* The successful candidate, who is one of a large number of applicants, has been chief assistant engineer to the Birmingham Tame and Rea Drainage Board.

ELECTRIC NOTES.

THE Municipal Electrical Association will hold their annual meeting in Edinburgh in the end of June, and propose visiting Glasgow on the 28th of that month, with the view of inspecting the various electricity works belonging to the Corporation.

A NEW section of the South Lancashire Tramways Company's service between Tyldesley and Boothstown has been opened for traffic. It is now possible to travel almost from Manchester to Liverpool by electric car. The exception is a stretch of about two miles between Boothstown and Winton.

THE Government of Ontario has under consideration a plan for the operation of the Government owned railways in the province by electricity. The required power could be easily generated by the numerous waterfalls in the provinces, and it is believed the result would prove cheaper than can be obtained by the use of steam.

THE Stepney Borough Council's electricity committee reports that a gross profit of a fraction over $6\frac{3}{4}$ per cent. on the capital employed at the end of the year has been realised. After providing for interest, sinking fund and other charges, a net profit of a fraction under $2\frac{3}{4}$ per cent. has been made.

IN a report on the railways of the United States by the Hon. Robert Collier, of the British Embassy at Washington, it is said with regard to electric traction that while electricity is almost exclusively used as the motive power of the extremely numerous tramways in every part of the country, on railways it is used to a very limited extent only; the overhead railways of New York and Chicago are the most conspicuous instances. For working trains through tunnels where the traffic is intense and for suburban work in general it is probable that electricity will be more and more used as the motive power, but the prospect of anything like a revolution in the direction of its being employed to work long distance railway traffic seems remote.

ACCORDING to the report of the British Consul at Venice there are several projects mooted for the institution of electric trams in the Venetian provinces. One, which would be undertaken by a Berlin firm, is to construct branch lines

starting from Venice, Padua and Treviso in different directions, chiefly through districts not traversed by the railway. At Verona there is a project to build an electrical railway to pass through Lazise to Riva di Trento, apparently to join the main line of the railway. The Belgian company which has the concession for running the horse tramways in Verona will transform them into electrical lines. The force will be derived from the river Milani, which will provide sufficient power not only to propel the carriages in the town but also to transform the steam tram line Verona-Cologna into an electrical one. Other projects are under discussion at Vicenza, Udine and Belluno, and as waterfalls are plentiful in the Venetian region, there will probably be a great development of electrical lines in future, unless modern invention provides economically running motor cars, as no tracks would be required for them.

BUILDING AND BUILDERS.

THE Chelsea workhouse has been extended at an actual cost of 32,131*l.*, or nearly 700*l.* less than the contract price.

THE streets and buildings committee of the Preston Town Council have approved of recommendations which will lead to the extension of the fire station in Tithebarn Street at a total cost of 1,950*l.* Four houses in Everton Gardens are to be purchased for 740*l.*

Kemp's Mercantile Gazette records that the number of failures in the building and timber trade during the week ending on the 21st inst. was lower than that of the corresponding weeks of the two previous years. The exact statistics are twenty-one failures in the present year, thirty-one in 1904 and twenty-three in 1903.

THE municipal authorities of Antwerp invite tenders for the supply of material for and the construction of a public exhibition hall to be erected in the Place de Meir, Antwerp. The adjudication will take place on May 23, and a deposit of 800*l.* will be required to qualify any tender. A copy of the specifications may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

MAY-OATWAY FIRE ALARM.

WHAT USERS SAY.

Messrs. J. Thomasson & Sons, Spinners, of Bolton, write:—"A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily, 10 minutes before the Automatic Sprinkler went off." Loss £48. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works, Edinburgh, write:—"A fire broke out in our factory during the dinner hour on January 18, 1905, when the May-Oatway installation (put in since our previous fire) saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well." Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.O., Premier, writes:—"This system has been largely adopted in New Zealand, and has given the greatest satisfaction." (The Government are the largest users; protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—"Fire" March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss." Claims paid, £10 and £80 respectively. What have you done to limit your loss?

Send for circular, or call and inspect 94 Paul Street, E.C.; Glasgow, Liverpool and Manchester.

TERRANO FLOORING.

A new flooring has been introduced into this country which is known as Terrano flooring (system Beck), and for the manufacture of which works have been opened at Stratford. It has a great success in Germany, and its merits have been certified by a large number of architects and builders. Its strength and fire-resisting qualities have been testified by official experiments in Berlin and Munich. Terrano is a remarkably light material, for a square foot of the thickness of $\frac{3}{8}$ inch weighs only 2 lbs. It can therefore be used where heavier materials would be unsuitable. Being warm to the feet, fireproof and entirely jointless, without seams, cracks or pores, it is from a sanitary as well as from a technical standpoint an excellent floor-covering. Floors are laid in a plastic state, very much after the manner of cement. They harden quickly, and can be used within a short time. When finished they form a continuous, fine-grained, smooth surface without any joints, and will never become slippery.

The manufacturers claim that Terrano will never chip, crack or tear loose from its base, nor disintegrate unless caused by structural defects of the base. The flooring is especially adapted for hospitals, asylums, barracks, schools, factories, public halls, &c.

It is impervious to heat and cold, clean, comparatively noiseless and elastic. Old or new wood floors, when covered with this material, are rendered fireproof, and give a soft and pleasant effect in walking. It has sufficient elasticity to save it from abrasion in ordinary wear. Should through any accident repairs become necessary, they can be made at a nominal cost, making the floor equal to new. The method of laying and finishing this kind of flooring hermetically seals the entire surface, making it impossible for germs to gain an entrance. It is made in various shades, such as red, yellow, slate, green, and can be laid either in self colours or with borders of another colour, producing a very pleasing effect.

THE Stafford Rural District Council have approved the plans and estimates of Messrs. R. E. W. Berrington & Son, civil engineers, Wolverhampton and Westminster, for the drainage of Castle Church and Tillington, at 9,000l.

THE BUILDING TRADES EXHIBITION.

THE Agricultural Hall has proved its utility as a place of exhibition, but if some authority proposed that the paintings in the Royal Academy were to be removed to it there would be a rebellion of artists. It denotes both courage and confidence in their work for Messrs. Diespeker to display their pictorial mosaics under so fierce a light. They have so arranged their stands that the most scientific or mechanical passer-by can scarcely help stopping to look at so much brilliancy. The largest and most striking feature is a group of three Gothic panels; the centre represents the Ascension of Christ and the lateral Adoring Angels. The whole, of course, is executed in the patent British glass mosaic of the firm, and demonstrates the admirable effects obtainable from its use. There was no little daring in selecting so sublime a subject, for it is one of peculiar difficulty and calls for the utmost skill for a satisfactory solution. The result proves their self-confidence was not misplaced. The work is to serve for a reredos of a London church, and we shall be interested to see it *in situ*, for it cannot fail to illuminate as well as adorn the building. Many other specimens of British glass mosaic are shown, the subjects being both religious and secular. Skill of a kind different to that demanded in treating the Ascension appears in an allegorical frieze in five panels representing the progress of the world. On the stand it shines by reflected electric light, and the figures show out brilliantly. Messrs. Diespeker apply their process to strictly utilitarian subjects with equal success, such as steps, decorative sign letters, directional information for side walks, Roman and Venetian marble mosaics of all sorts in varying styles and designs, &c. Their patent marble mosaic steps deserve special notice. Messrs. Diespeker are showing specimens of steps that have been fixed by them at the new Lyceum Theatre, the Chelsea Palace Theatre, the National Hall in Glasgow, and at many other theatres, music halls, schools and hospitals, notably at the London Hospital, in which latter place the steps have been treated in such a manner that there is no right angle of any sort. From the point of view of sanitation and cleanliness this method has much to recommend it. The steps shown are very effective in appearance and give a

good foothold. The majority of Messrs. Diespeker's exhibits are reproductions of past commissions and deserve to obtain others in the future. A notice on the stand states that a new process of wall mosaic will shortly be submitted to architects, which Messrs. Diespeker expect will revolutionise the treatment of wall spaces. We are looking forward with curiosity to seeing this new method, and remembering the achievements of Messrs. Diespeker in the production of mosaics during the last twenty-five years, we have no doubt that the big words with which their new production is being heralded will be well justified.

"The Magic Window Balance"—shown by *Recorders, Ltd.*, London, E.C.—merits a welcome from imperialists. It has come from Australia with the strongest recommendations from a brief selection of users, which include the Government Architect's Department, New South Wales, and many public institutions. The list is especially valuable as giving assurance that the balance does not fail to fulfil the expectations which are aroused by an examination of the exhibit. The entire window works on a balance fitted in the centre which is so contrived that a large window can be opened or shut with one finger; indeed, the larger the window the easier is the working. The absence of all weights, pulleys, cords, &c., results in the pleasant fact that the windows and frames are actually cheaper than the ordinary style. The windows open in the middle as well as at the top and bottom. Cleansing operations are rendered extremely easy, for the top sash can be lowered and reversed and the bottom sash made to hang free. The working is noiseless, the windows cannot rattle and are water-tight.

Messrs. H. T. Rayner & Co. have adopted an excellent method of showing their tiles, for they have erected a cottage with walls made of them. Unlike many buildings, the back is deserving of as much attention as the front, for there are several courses of their smut-faced tiles to which by a special process is imparted an exact appearance of having withstood the effect of time. The Rettendon sand-faced as well as the smut-faced tiles are sold with holes as well as nibs. The manufacturers, with whom is associated Mr. J. J. Etridge, jun., of the Bethnal Green slate works,

CATHEDRAL SERIES.—ST. ASAPH: NAVE FROM CHANCEL.

recommend the use of the nibs in preference to nailing, as being less injurious to the tiles and allowing of free expansion and contraction. The breaking strain of the tiles is very great as, although made of a soft clay, they are pressed and dried by special machines. The roof of the cottage is formed of "Precelly green" slates, supplied by Messrs. Davis Bros., in four different shades.

The *Harman Electric Hoist* works noiselessly, but on the temporary staging of the Building Trades Exhibition, to run on which is a test, it makes noise sufficient to attract attention, and when a visitor sees a barrow-load of firebricks or heavy material moving up and down he is almost certain to want a closer inspection. The hoists merit examination, for they meet the requirements of a small lifting-gear, and will be invaluable to builders. The two standard sizes made lift 8 cwt. and 1 ton, but intermediate sizes can be obtained. The first lifts its weight at the rate of 80 feet per minute and the second 100 feet; but the rate can be decreased if desired. The drum will take 350 feet of wire rope. It can be easily transformed from a lift for moving building materials to use for passengers or warehouse goods. The mechanism is self-contained and weighs 7 cwt. Messrs. R. Harman & Co. supplied one of their lifts to the Columbian Fireproof Company in their contract for the Ritz Hotel. In eight working weeks it lifted 11,000 super yards of concrete at an average rate of 60 tons per day.

The *Aston Magna Brick and Tile Co.* rely principally on their special red pressed facing bricks to represent them. A plinth wall about 3 feet high has been laid, and the roof is made of the "Magna" miniature roofing tiles, in imitation of Dutch examples. The other varieties include sewer and engineering wire-cut bricks, hand-made, pressed and

unpressed roofing tiles, and ornamental and architectural terra-cotta. A specialty of the company is their porous fireclay patent division tile, which is light, soundproof and lightproof.

The five bays, Nos. 25 to 30 in the gallery, occupied by the *Art Pavements and Decorations, Ltd.*, have drawn a steady stream of visitors. Last week we gave a hasty glance over the entire exhibit, and referred amongst other things to the display of marbles. A longer acquaintance with the display has increased our admiration for its variety and beauty. A few of the names of the different exhibits will prove the first point, and an inspection will more than justify the latter description. In one bay there are slabs many feet in height of Connemara green, Venato statuary, Vert Campan, Rouge Jaspé, Piastraccia, Greek cippolino, Verde Antico, Breche Tinolonet, Skyros, Listavenna, Jaspé Teba and Vert-des-Alpes. One slab is a specimen of the Listavenna which was selected by Mr. W. Campbell Jones, architect, for one of the branches of the London and County Bank, for which the contract amounted to 10,000/. Another contract is for 15,000 yards super at the new War Office, and seven miles of border, requiring 25,000,000 cubes, using 350 tons of marble.

The "Ruberoid Roofing and Damp-course" left the experimental stage over twelve years ago, and now appears in the light of a well-tried and ever-faithful friend. It is therefore almost superfluous to point out its merits, uses or method of manufacture. A model of an American cottage shows on a small scale the appearance and manner of laying this high-grade felt roofing. The material is manufactured in four plies, but this does not mean four qualities, for each ply is the best that can be adapted to the particular purpose for which it is intended; $\frac{1}{2}$ -ply is for buildings not subject to severe wear, such as hen-houses, while 3-ply cannot be surpassed for use in large roofs, and will sustain the severest climatic conditions. Ruberoid flooring resembles the roofing in being of the best. Contractors and builders should also not fail to inspect the diaphragm pump, which is adapted for working in excavations, foundations, &c., for it will discharge water and semi-liquids containing mud, sand, gravel, &c. One man can pump out three or four thousand gallons in an hour. Messrs. Robert W. Blackwell & Co. Ltd., show many other

things which claim the attention of those interested in building, including the P and B paints and insulating papers, gun-metal cocks, valves and all other tools.

At Stand No. 13 the *Patent Adjustable Bath Company* have an exhibit of their patent bath, which should be of value to those who are interested in the erection of cottages.

The "*Clipper*" *Belt Hook Company* have an exhibit at Stand No. 15 of their patented belt tools and hooks for fastening driving belts. To all users of machinery this patent should be of interest owing to its simplicity and low cost. Other specialties shown by the firm include their "Anchor" wall ties. They also show the "Capstan" clothes-line holder, which prevents defacement of walls; all driving of nails, hooks, &c., which loosen the mortar, bricks or coping, is done away with.

At Stand 16 will be found the exhibit of fire-resisting partitions shown by the *Excelsior and Phoenix Fire-resisting Partition and Ceiling Company, Ltd.* The partition, which is largely made from pumice stone, is claimed to be perfectly rigid, thus avoiding any chance of cracking. The title of the firm is much too long for any trading concern, and might with advantage be shortened.

The "Standard" system of paving for roadways and pavements was introduced many years ago by *Messrs. John Hirst & Sons*. Its main feature is the introduction of a thin metal strip between the courses and in the joints. There are many advantages claimed for it, such as greater durability, perfectly even surface, ultimate economy and ease of executing repairs. They also exhibit a big assortment of sanitary goods, such as their patent slop shutes or hoppers, channels and grates.

The largest object on the stall of the *Ingham's Firebrick Company* is their 24-inch diameter combination inspection and distributing manhole, which receives sewage in one position and distributes it in one, two or three directions. Grooved slots are placed in front of each outlet for cutting off the supply to any one filter bed. On the top of this manhole a 24-inch diameter pipe fits so as to allow access from the top, and these pipes can be cut to any length suitable to the ground where the trap is to be laid. It is then possible to fit an iron lid to the top of the trap, forming a complete cover to the whole. There are many other objects in the stand which will be of interest to those con-

cerned in sanitary work. The company include among their manufactures gullies, chimney-pots, garden vases.

At Stand 31 will be found the exhibit of the *British Felt Company* and the *Coolmore's Durable Roofing and Asphalt Company*. The sheet asphalt for roofing and damp-course has been largely used throughout the country. *Messrs. Standring & Co.* have an exhibit at this stand of their "Thistle" brand of sash cords, sash lines, &c.

At Stands Nos. 32 and 33 an excellent exhibit is made of *The Stonwood System of Fireproof Floor*. The exhibit is well worth the attention of any visitor to the exhibition. The system is a simple and expeditious one; the material is made in various colours and laid *in situ* whilst in a plastic state either on concrete, boards, or any other foundation. In a few hours it is a hard compact mass, and is then scraped and oiled; the result is an excellent surface which can be polished like a parquet floor. Space will not permit of an extended notice of this system at the present time.

The *South British Trading Company* show at Stand 34 the Bardsley improved oil door check and spring, which we have referred to frequently before. The spring is distinctly a good one and has many advantages. His Majesty's Office of Works and His Majesty's Post Office architects have frequently specified them, and they have given every satisfaction.

Stand 37 is occupied by the *Newellite Glass Tile Co.*, who are exhibiting tiles which are coming into favour owing to their value from a sanitary point of view. This firm is evidently satisfied that in claiming that they will not crack or peel they are fully justified, as they offer to leave an amount of 10 per cent. on each job undertaken by them for the term of two years against repairs, should such be required.

Another example of fireproof partitions is to be found at Stand No. 40. The *Acton Concrete Partition Co.* are showing their partitions, for which their principal claim seems to be cheapness of price and expeditious erection.

Messrs. Jas. Price & Son have an exhibit at Stand 41 of their *Chez-lui* hard drying enamels. We have described this enamel before, particularly the special bath enamel, which has for years past given the most satisfactory results. The *Chez-Lui* enamel stains, which are supplied in seven different shades, are worth attention; they have a good

WILLIAM GREEN & CO. (Ecclesfield), Ltd., ECCLESFIELD, near SHEFFIELD.

ish and the gloss resembles French polish. Examples are shown of baths, lavatory basins, pedestal closets, &c., which are distinguished by the name of "The Charlton" and for the excellence of the enamelling.

Mr. B. T. Batsford, the enterprising architectural publisher and bookseller, is represented at Stand 43, and has a most interesting exhibit of architectural and technical books. The name of Batsford is too familiar to our readers to need any passing comment in a notice of a trade exhibition.

Mr. Thomas Potterton at Stand 44 has a good show of domestic ranges and kitcheners.

For many years past *Vulcanite* has occupied a space in the Building Trades Exhibitions; their exhibit will be found at Stand 45. We have frequently referred to the usefulness of this material. On this occasion they are showing a model house with the patent *Vulcanite* roofing on a flat wooden roof.

Messrs. Howard Bros. at Stand 46 are exhibiting their patent "Dey" time register, showing their combined time and wages sheet for time-keeping, a necessary adjunct in every works; the system seems to be a simple one.

As usual, Messrs. D. Anderson & Son occupy the same position at the Building Trades Exhibition. The number of their Stand is 59, where they have a representative show of their well-known *Stonifex* roofing felt, tarred felts, damp-course, &c.

A new firm is to be found at Stand 61. The *Asbestic Brick and Tile Company* have an interesting exhibit of their asbestos bricks in various colourings. The French grey is particularly pleasing. Briefly the system is a simple one; the brick produced is of good colour, hard as Portland stone and with a particularly good face. They are made of a mixture of asbestos, lime and sands, and can be produced for use within twenty-four hours, or in even less time if required. The company are prepared to erect plant and machinery in any district. We shall be referring to this new system in a subsequent issue.

We have so frequently mentioned the *Adamant Company*, whose exhibit will be found at Stand 64, that it is difficult to again refer to them. The *Adamant* system is well known to our readers. The material shown by them at this year's exhibit is moulded and modelled in the special moulding material described by them as No. 2A, and the ceiling is in

special fibrous *Adamant*. The repeated statements made by us of the value of *Adamant* have been more than verified by the popularity of this material and the increasing sales from year to year.

Stand 68 is occupied by the *Plaster, Brick and Stone Company*, who have an excellent exhibit of their "Pytho" plaster. The material has a fine, well-finished surface, and is being largely adopted in the Staffordshire district and the Midlands generally. This is one of the new firms in this year's exhibition, and their exhibit has been favourably referred to by many architects visiting the hall.

At Stand 71 Messrs. G. Aston & Son are exhibiting principally the fireproof material known as "The Fram" system. The material is light and easily erected. A model light iron building is shown, illustrating details of construction and showing a lining of "Fram" insulating and fire-resisting boards.

Messrs. Potter & Co. at Stand 72 show an armoured concrete floor 5 inches thick and 10 feet between supports. Also, besides several other specimens of floors and partitions, an armoured concrete lintel which has withstood the test of a load of 10 tons.

Messrs. Hofler, Ltd., are exhibiting at Stand No. 74 specimens of wall-papers, ironwork and oak panelling, made either in Germany, Austria or France. The oak panelling and fittings are of good workmanship and effective.

In a special central position, known as No. 3, will be found one of the best exhibits at this year's exhibition. The *Crittall Manufacturing Company* have an excellent display of art metalwork, consisting of an ornamental glazed screen showing various designs of stained glass, &c. A large pair of iron doors are exhibited which have been made for the Duke Street electric-light station. The ironwork shown at this stand is a distinct proof that English art metalworkers can still hold their own in this artistic branch of industry. Messrs. Crittall are showing also a new casement distinguished as "The Fenestra." It consists of a frame without any mitreing. One bar is threaded through the other. It is simple and effective.

At the stand of Messrs. Samuel Elliott & Sons at any exhibition will always be found excellent workmanship combined with artistic taste. At their Stand, No. 95, this

Gilbert Wood & Co. Ltd., 6-11 Imperial Buildings, Ludgate Circus.

year will be seen examples of their work which will well repay a visit. Probably the best possible proof which can be given of the excellent examples of joinery, woodwork, &c., exhibited is the fact that during last week one contract alone for many thousands of pounds was entrusted to them by one of our largest London firms. Some particularly fine specimens of doors, mouldings, &c., will be seen. The beautiful doors designed by the architect, and which Messrs. Elliott & Sons are fixing at the Roman Catholic Cathedral at Westminster, would have been shown but for the fact that Messrs. Elliott were not permitted to exhibit them. Another good example of their work was, however, on exhibition last week of a door for one of our new theatres.

We described recently Messrs. Carter & Co.'s Stand, No. 96, giving an illustration of this firm's exhibit. Their designs of tiles are too well known amongst architects for us to more than add that some excellent examples of their work are to be seen.

Messrs. Thomas Pascall & Sons are showing at Stand 113 some examples of their Wrotham bricks which are of an excellent colour; they are in three shades of red—dark, medium and light. At the same stand they have an exhibit of their sand-faced roofing tiles.

In the wall space under the gallery will be found Messrs. Yates, Haywood & Co., Ltd., with an exhibit of wood mantels, mantel registers, hospital stoves, baths, closets, lavatories, &c. The patent "Guinness" self-setting ranges exhibited here have many claims for support. The well-known "Quadrant" lift-fire kitchener is of simple construction and easy to work.

Messrs. Crossley Bros. are to be found, as usual, at Stand 121, under the gallery. Their exhibit of gas-engines is of interest to all who are conversant with the value of this indispensable invention. In the early days of gas-engines Messrs. Crossley earned a well-merited name for their "Otto" gas-engine, which has been fully retained by the firm to the present day.

Mr. John Tann has a display of Tann's safes at Stand 123. The "Anchor" reliance safe has been described in these pages for many years past. The firm has been established for considerably over 100 years, and probably the best proof of good workmanship is the fact that the business is a pro-

gressive one. Mr. Tann has rightly earned a name for good workmanship and for using good materials, and the fact of this firm having a continuous history of over a century is the best proof that the above statements are correct.

The windows shown by the *Perfector Window Co.* are claimed to be suitable for any building, whether a mansion or cottage, hotel or factory, hospital or warehouse. The window is a sash window as well as a reversible window. The sash stile is made in two parts, hinged together so as to allow it to revolve sufficiently to bring the outer surface of the glass within reach of a cleaner inside the room. The closing of the sash draws the two parts together, making the window perfectly waterproof and free from all rattle. No beading has to be removed or screws taken out to render the window reversible. Free ventilation for the room is insured. The sashes can be fitted to any existing windows and any fastener or opener can be used. If a cheaper method is desired the centre and beading can be fitted without sliding sashes, to turn on centres only.

Velure has so firmly established itself that few architects, decorators, or any others connected with building can have failed to have had it brought under their notice. Its qualities are partly demonstrated by the strips of tin to be obtained at the stall of Messrs. C. Chancellor & Co., and which, no matter how much they are bent or beaten, show no sign of cracking or peeling. Nor will it peel, blister or fade. Its weathering qualities are, indeed, as remarkable as its economy in use. *Velure* floor paint has advantages which will recommend it to the householder. It can be applied to wood, stone, floorcloth, &c., and will be fit to be trodden on within a few hours. The variety of stock colours is steadily increasing and now numbers ten, one of the last being white, for which there is certain to be a general demand.

The *Phoenix Patent Roofing* presents a novel idea of great interest. The main features are a true joint between the covering material, whatever it may be, and a metal joint protector. In slate roofs the number of slates is reduced by 50 per cent. owing to no overlapping whatever. This removes the necessity of four rafters out of every five and only one-half the battens. The smooth surface of the slate is placed outside with a distinct gain in appearance. The saving of cost is, in consequence, reduced by more than

per cent. over the usual timber roof. Slate roofs are only one of the materials to which this system of jointing can be applied. Where glass or galvanised iron are used it is equally efficacious and economical.

The specialties of the *Phoenix Engineering Co., Ltd.*, are of a sort to attain picturesqueness, but they are not the less important. "Floodgate" and "Highland" pumps are made by side with tar and pitch boilers, hand and horse road-crappers, water-carrying vehicles, &c. There is a business-like impression made by this stand.

Venetian blinds do not admit of much scope for invention, and therefore the greater is the credit due to *Wapler & Co.*, Fulham Road, S.W., for having secured a new article. The principal novelty is seen in their own patent check action, by means of which the blind stops automatically at the height where the pulling action ceases. This is an obvious advance on the old system of laboriously fastening the cords round a knob. The labour of raising a large blind has been reduced by more than one-half, as the laths are made extra thin, and this has the additional advantage of elegance. The ability to employ thin laths is the result of a secret method of preparing wood so as to render them impossible to twist or warp. *Wapler & Co.* facilitate the work of housemaids by the ease with which the blind can be removed from the iron brackets and cleaned lath by lath, for nothing impedes the washing of the windows.

Versatility is displayed by *B. Ward & Co., Ltd.*, who show themselves as equally ready to lay granite concrete paving, reinforced concrete floors and partitions, mosaic paving and staircases or wood-block flooring. Their patent non-slipping leaded treads for stairs may be seen as finished, and the lead grid is also shown separate. The lead dots are hardly noticeable on the surface; the principal advantages gained by their use are a non-slipping surface and increased durability. The wood-block flooring gives the effect made by Austrian oak, pitch pine and maple. The appearance of the exhibit is greatly dignified by a short colonnade in artificial stone.

The *Safety Lift and Elevator Co.* (M. T. Medway) show one of their self-sustaining dinner lifts which is suitable for hotels, restaurants, or private residences; they are guaranteed to be noiseless and trustworthy. The gear consists of a large hauling wheel, V-wheel, to prevent

the manilla or hemp rope chafing, and brake wheel with lever. The whole contrivance is easily fixed. The self-contained gear for an electric passenger lift can also be seen in operation. The collapsible iron gate works in connection with it, in order that the lift cannot be started until the gate is closed, and the gate will not open until a spring is released by the arrival of the lift. The lift is operated by means of a hand-switch inside the car. There are special emergency devices.

A list of contracts in the hands of *Messrs. R. Waygood & Co., Ltd.*, would give an idea of their world-wide reputation. Every year they turn out more than 1,000 lifts and cranes. In London, Johannesburg, Belfast or Newcastle their work is equally esteemed. The fact that fifteen lifts are to be despatched for installation in the Carlton Hotel, Johannesburg, is a welcome proof that the manufacturers of this country are able to hold their own in an international market like South Africa. They are showing a direct coupled electric lift gear, an automatic electric dinner lift, and a hand-power lift, with various accessories. The passenger-lift gear includes a patent controller, and the lift is operated by automatic push buttons in the cage, so that the lift automatically starts and stops on the desired floor. The dinner-lift has a special shutter, by which, should the shutter be open while the lift is in motion, the lift will stop, in order to prevent it descending on anyone should they put their head or hand in the well-hole. The hand-power lift will carry about 84 lbs., and is controlled by a foot-brake.

An important feature of the exhibit by the *British Fireproof Construction Company* is their patent ventilating partition with various joints and enclosures. The partitions are 3 inches thick and are made 18 inches to 6 inches in length. The joints are filled with breeze concrete, 1 inch in width, into which wood fixings may be nailed. When fixed the partitions weigh 14 lbs. per foot super. The air ducts in the partitions run from top to bottom of the buildings, and may be connected with inlet and outlet flues at any desired point. The system is to be found in Stobhill Hospital, near Glasgow, Guy's Hospital, Wakefield County Offices, &c. A concrete-steel beam is seen loaded with bricks, showing vertical joints; although the weight is 5 cwt. per foot super, only a slight deflection has resulted. The bay occupied by this company shows arched and sloping con-

crete roofs. Their hollow-tube system of fireproof floors, showing tubes from $5\frac{1}{2}$ to $10\frac{1}{2}$ inches deep, is seen in section.

The unusual sight of a revolving stand of architectural drawings in constant motion helps to attract attention to the display of Messrs. Norton & Gregory. The device fulfils its purpose, as soon as the visitor walks up to the

stand. At least one novelty is seen there, in the latest "Perfect" adjustable drawing-table with a T-square attachment. This attachment consists of two double-pulley

brackets, two single-pulley brackets, bolts and screws and fine wire-cord, and may be bought separately with or without a special T-square. Norton & Gregory's "New Black Line Process" is familiar to most professional visitors. Its permanency is shown by one of the photo-copies on the revolving stand, which, although executed four years ago and ever since exposed to a strong light, is still as clear as if it were done a week ago. The "New Idea" spring hinge is another feature which has long since made its way into the market and which increases in favour as it is more widely used.

Many specialties in building construction which might be termed vital are shown in the stand of Messrs. F. McNeill & Co. All are materials for use, and comprise damp-courses, sound-deadening, fireproofing, roff-lining and plastering. Felts in many varieties are shown, such as sarking and inodorous felts, bituminous and dry hair-felt. Their fibrous asphalt damp-course is seen in use through the medium of a small tank holding some courses of a wall, with the water an inch below the damp-course. Messrs. McNeill are not content with the reputation they have gained by this course, for they now offer another which is made of pure bitumen, and guaranteed free from all coal-tar or coal-tar pitch. It is made in lengths of 24 feet, and the stock widths range from $4\frac{1}{2}$ inches to 36 inches. Slag wool enters into many of the articles, as it is, of course, soundproof and fireproof.

The patent "Heaped Fire" grate is seen in action at the exhibit of Messrs. Bratt, Colbran & Co. Lord Windsor, in opening the exhibition, laid stress on the necessity for more general endeavours in the abatement of the smoke nuisance. There are no front bars, the coal being heaped against the back brick, and the fire is in full view. A steady incandescent fire results from the draught suction, with perfect combustion. It can be fed in front like a boiler furnace, pushing back the red-hot fuel and thereby partially consuming the smoke. Messrs. Bratt, Colbran & Co. are issuing this week from their warehouse, Mortimer Street, London, W., a new catalogue illustrating various artistic types of the "Heaped" fire.

Messrs. Casebourne & Co., Ltd., West Hartlepool, show a model of their new "Pioneer" cement works at Hayerton, Hull-on-Tees, co. Durham, on a scale of 1-16 inch to the

not. The works were designed by Mr. H. W. Anderson, C.E., London. In addition, copies are shown of tensile and compression tests made by independent experts.

Lincolnshire red-tile goods are shown at the gallery and of Mr. J. W. Briggs, Barton-on-Humber, Lincoln. They include bricks, plain and ornamental ridges, tiles, chimney-pots, flower-pots, finials and drain pipes.

Although the "Safety" Water Elevator Company (or Conet's Patent Well Gear), London and Dunstable, are a comparatively new company, they can already point to numerous successes and show many unsolicited testimonials. For wells of a depth greater than 30 feet or 40 feet it is claimed to be considerably cheaper than other kinds. The elevator to be seen at their stand allows of an examination of all the claims advanced on its behalf. The elevator is a solid cast-iron plate, which is placed over the aperture of the well, thereby protecting it against the introduction of animal or vegetable matter. The stool dome is perforated, but has netting inside to prevent the entry of any matter; the mouth of the spout is likewise carefully protected. Inside the dome there is some simple mechanism. The two buckets are one of the patented novelties; they have a circular aperture in the centre of the bottom, closing or opening by a disc or valve. Any depth of well is worked with equal ease, and a child can draw 500 gallons in 30 minutes. The company are so confident in their invention that they are willing to send an elevator for trial in the United Kingdom free of charge, and which may be returned if not approved.

The Patent Indurated Stone Company show their material in its natural colour and matching Whitbed Portland stone, brown Portland stone, terra-cotta, red and yellow Mansfield. The forms are decorative and include balustrading, sundials, moulded pier-caps, vases, &c. An elaborately ornamental panel in Harley stone shows how readily the stone may be carved. The floor of the stand is paved with the hydraulic pressed paving slabs supplied by John Ellis & Sons, Ltd., Leicester.

The Rowlands Castle Brick and Tile Works, Ltd., Hants, contribute a selection of plain and ornamental deep-red facing and ornamental bricks and tiles, which are remarkable for their colour. As with their old-fashioned sand-faced roof tiles, exceptional weathering qualities are

claimed. The raw materials used in the manufactures of the company are to be seen, and the colours of the clays are many, for they include black, grey, brown, yellow and deep red. A test of the brick was made by Messrs. Kirkaldy, and it sustained a weight of over 300 tons per square foot before crushing. Their hand-made tiles have gained favour among architects by the way they quickly vegetate. The blue bricks have the recommendation of being blue right through.

If the Building Trades Exhibition were being held in Scotland instead of in London there would be little need to give explanations of Brown & Co.'s "Simplex" window fittings, for they are known throughout North Britain. In Glasgow and elsewhere the building regulations ordain that all windows must be made to open inwardly. These fittings leave the balance weights as before, allowing the window to rise and fall, to open inwardly, arresting the weight automatically when it opens, and re-engaging it when closed. A cheaper form of the window releases and re-engages the weight, but not automatically. The fittings have the somewhat unexpected recommendation of being a very efficient protection against burglars. The lower sash could not be lifted from the outside. Brown's raw hide "Simplex" sash-line is used as being very flexible and enduring, tough and cheap.

The destructor clinker paving slabs shown by the Patent Artificial Stone Co. suggest the eminently useful purposes to which refuse can be put. They are the sole vendors, patentees and manufacturers of anti-sulphite for use in these slabs.

In times of international competition in the open English market it is reassuring to hear of the success of Hartley & Sugden's, Ltd., cast-iron and wrought-iron boilers and radiators. Less than a year ago the company added a new department to their foundry and introduced a new cast-iron sectional boiler—the "White Rose"—for warming by low-pressure hot water. Series A met with such general success that it was supplemented by Series B, which was of a smaller size. Messrs. Hartley & Sugden have found that the demands were still unsatisfied, and have now in hand Series C. When this is ready for placing on the market it will be possible to obtain boilers with heating power ranging from 300 feet to 6,000 feet. The "White Rose" radia-

tors for hot water or steam are another recent addition to the useful specialties of this firm. The improved independent "Savile" boiler is especially designed for heating water for domestic supply in hotels, clubs and country houses and private residences. The boiler is so arranged that in case of the water containing sediment the deposit falls below the level of the grate bar, where mudholes are provided, so that it may be easily cleaned out.

The impregnated foundation felt of Messrs. *Mitchells, Ashworth, Stansfield & Co., Ltd.*, is made entirely from wool, milled so firmly that it is very slightly affected by ordinary pressures, and a special grade is produced for extra heavy work. Nevertheless its elasticity enables it to very largely overcome vibration and neutralise any jarring, as may be seen by the tests of Messrs. D. Kirkaldy & Son. The surface of the felt is treated by a chemical process in order to prevent wearing, the penetration of water, &c., and the body of the felt is pregated with a special oil, rendering it impervious to moisture. The sheets vary in any thickness from $\frac{1}{4}$ inch to $1\frac{1}{4}$ inch, are in three grades of hardness, and the largest size is 60 inches by 30 inches, but it is cut to any specification, and if a large bed is required, the sheets are cut to fit exactly. It is used as a bedding for rails, bridgework, columns, girders, machinery, gas-engines, steam-hammers and presses. The company are also exhibiting samples of non-inflammable roofing and flooring felt, which is an excellent non-conductor of fire and sound, imparting coolness in summer and warmth in winter.

If it is possible to attain a perfect solution of the problem of housing, it is most likely to come from the combined efforts of the philanthropist, the designer and the manufacturer striving for a common goal. It is, therefore, a most hopeful sign to find these qualities united in a single individual like Councillor James Cornes, who has for many years past made the subject of the housing of the working classes a special study. Not content with theory, he himself erected a colony of workmen's dwellings in Leek at an outlay of nearly 20,000*l.*, and these have attracted widespread attention from local authorities and others. The houses are let at 5*s.* 6*d.*, 5*s.* 9*d.* and 6*s.* 6*d.* per week. Mr. Cornes devoted special care to the facilities for the cleanliness of his prospective tenants, and devised a combination forming the basis of an invention which would be something

altogether new. The Cornes & Haighton apparatus was the fruit of no little mental labour and experiment.

The apparatus combines heating, cooking and washing, with the use of a hot or cold bath and a shower. The range is fixed in the kitchen, the grate being in the centre, with an oven on one side and a boiler on the other. The boiler has a capacity of 12 gallons of water, 10 gallons of which can be run off. Risks of explosion are avoided, and it is automatically supplied by a feed-cistern. The fitting is so arranged as to abut on to the dividing wall of two rooms, such as a kitchen and scullery, and is accessible from both rooms. Clothes can be boiled in the copper. The scullery portion of the apparatus acts as a radiator to this room, and the temperature need never vary from that of the living-room. There is thus effected a great economy in space, labour and material.

about and material.

We have referred in detail to the apparatus as it is one of the most remarkable features of the workmen's dwellings. In the two years after its development over 1,000 complete fittings have been installed in municipal or private housing schemes all over the country. The usefulness of the invention will be still further increased by the recent amalgamation of the *Ellkay Patent Bath Syndicate, Ltd.*, the *Ellkay (Colonial, Foreign and Export) Syndicate, Ltd.*, and *Cornes & Highton, Leek, Staffs.*, with a capital of 80,000*l.* This amalgamation will be known as "*Ellkay & Cornes, Ltd.*," and will supply (1) combined range, copper and bath; (2) range, wash-boiler, sink and folding bath; (3) wash-boiler, folding bath and bath boiler, for either coal or gas; (4) range, high-pressure boiler, circulating hot-water tank and folding bath, each being fitted in combination in the very best finish in a compact, efficient and sanitary manner, while being most economical both in the original cost and in the working. The combination of the "*Ellkay*" folding bath and *Cornes & Highton's* range and copper is certain to have a real influence on the housing question, for it has removed the cost difficulty in installing a bath in a workman's dwelling without a serious increase in cost and a loss of space. The "*Ellkay*" bath has been looked upon more as an accessory in hotels, private houses and flats than in workmen's dwellings. The novelty and attractiveness has in no way decreased. The stand of the company, in the vestibule

shows it in two or three qualities, together with various baths. The baths are in use from China to Peru. The small combination kitchener will go in an opening 2 feet 4 inches, and has an oven 15 inches by 14 inches, open and closed fire, and boiler, which forms part of the patent combination previously alluded to, which comprises a range, boiler, circulating tank, folding bath, copper and sink. By the arrangement water sufficient for a hot bath will be heated in thirty minutes with $3\frac{1}{2}$ lbs. of coal, while cooking is taking place simultaneously. It can be supplied and fixed in a cottage let at a weekly rental of 4s. 6d. without any increase of cost. Another stand shows the same apparatus on a larger scale. Experience has proved that the dwellings which possess these combi-

The "Marbut" machine-carved mouldings must be inspected in some hundreds of lengths at the stand of Cobbetts, of Bethnal Green. They are all of different and delicate colours. Other joinery, such as newels and balusters, are displayed.

A striking lead fanlight casting is on the large stall of Messrs. Smith & Wellstood, Ltd. Less ornamental objects are the ranges, boilers, ventilating stoves, &c. There are also many fireplaces with mantelpieces.

Concrete building bricks, made by the machinery and processes for utilising blast-furnace slag of Messrs. Sutcliffe, Speakman & Co., Ltd., are shown by them. They claim to make the most "limey" bricks without the admixture of lime or cement as a bonding material. Their double-shafted differential mixer is one of the machines they have brought to the hall.

South Devon stoneware clays are well known, and almost guarantee the quality of the goods supplied by Messrs. Candy & Co., Ltd., who have their works at Heathfield, Newton Abbot. They show white and coloured enamelled and dipped-brown salt-glazed bricks and other bricks. Buff terra-cotta garden vases and chimney-tops are very ornamental. Two Devon glazed brick fireplaces in grey and brown are shown.

The walls of the Fireproof Partition and Spandrel Wall Co. are built exclusively of iron, bricks and cement. The spandrel walls do not require continuous foundations, for they do not bear on the joists. This is shown in the length of walling erected, which is supported at each end and in the centre.

The patent glazing system of Messrs. Sam Deards is illustrated by a model. The firm have carried out many contracts of the Portsmouth and Devonport Dockyard, including one for glazing the new steam factory at Portsmouth, where it was for 102,000 feet super. Its water-tight claims are justified by the constant stream of water playing on the roof of the exhibit.

There is always a pleasure in seeing anything that may be described as "the very latest." Therefore those who inspect the appliances presented by Messrs. Joseph Richmond & Co., Ltd., should make a point of not overlooking their design for wrought-iron gates and section of enclosure. It is entirely automatic. The gates open in the centre, and

nation baths are in far greater demand among the working classes than those without. In addition, the possessors manifest a pride in their privilege by the scrupulous way they are kept clean. Thus it will be seen that the amalgamation of three such concerns as the Ellkay Patent Bath Syndicates and Messrs. Cornes & Houghton will most likely have a profound influence on the subject of housing the working masses. Mr. James Cornes and Mr. E. W. Lancaster will jointly manage the business. Mr. Cornes has written a review of the housing question in England under the title of "Modern Housing in Town and Country," which will shortly be published by Mr. B. T. Batsford.

are specially adapted for landings where the width is too small to permit with convenience of a hinged door. The gates exhibited are of a beautiful design. A 3-inch scale model of the Richmond-Carey patent automatic electric lift is in working order, and demonstrates how the services of an attendant are entirely dispensed with, through the self-locking apparatus for doors and starting apparatus. Three hand-lifts are to be seen.

The decorative capabilities of *Emdeca* are indicated by their handsome stand, combining on the exterior copper and zinc in a Classical treatment. The interior has a most bright and clean appearance, due to their embossed and enamelled zinc decorations. *Emdeca* will stand fumigation without oxidation, and is totally non-absorbent. It is cleaned with ordinary soap and water and is particularly suited for bath-rooms, lavatories, kitchens, pantries and passages. *Emdeca* paste, made up of one part white lead and two parts whiting, is used for fixing.

The *Standard Sanitary Manufacturing Company* have an excellent display of some of their specialties, which are to be seen on Messrs. W. J. Burroughes & Sons' stand, including enamelled iron baths, lavatories, &c. One of the baths is the same model as those fitted at the Midland hotel, Manchester. A special feature is made of the lavatories in one piece—the bowl, slab and back thus rendered thoroughly sanitary. The enamel is even throughout, adhering perfectly to the iron. The finish to all these goods leaves nothing to be desired. The enamel covers evenly all the edges of the castings and does not leave exposed the black edges often seen on enamelled iron goods.

A manhole covering, strengthened with expanded metal for electric-light boxes, is one of the novelties of the *Atlas Stone Company, Ltd.*, Cambridge. Its strength and lightness are noteworthy. The Atlas "Foothold" paving slabs are made under a hydraulic pressure of 400 tons from Leicestershire granite and the "Saxon" brand of Portland cement. It was, therefore, suitable that they should include on their stand the ingredients in various stages of the manufacture of this brand, such as the raw material before and after analysis, the calcined clinker as made in rotary and stationary kilns, and the final ground product. Two granite-concrete steps shown are the same as 1,000 steps supplied

to the London County Council for their artizans' dwellings. A Faija testing machine is provided to test briquettes made from the cement used for Atlas "Foothold" slabs. The mosaics of the company are Roman, glass mosaics, ceramic mosaics and terrazzo. There is also a concrete department.

At night the stall of *A. E. Podmore & Co.* is a thing of great brilliancy, due to the large number of their patent high-power and ordinary incandescent lamps. They are specialists in public lighting, and are manufacturers of all kinds of gas apparatus.

Geo. Jennings, Ltd., are bold enough to pass over most of their sanitary specialties, and have confined themselves to their more recent manufactures. For instance, the patent auto-mechanical operator is the first to be made by them, and is used in connection with sprinklers or feeders. The patent automatic sprinklers for sewage and water filtration, fed by a mechanically operated syphon, shown, is intended for a small village installation, and is very simple, efficient and reliable. A patent electro-mechanical apparatus indicates and registers varying levels of liquids, whether in outlying reservoirs, sewage-tanks or outfall sewers at any distance from point of observation. This has been in use for many years past, and is adopted by H.M. War Department. The entire body of the "London" warm fresh-air ventilating grate is made in a single piece of terra-cotta. The mouth and throat of flue is combined with the grate. All exposed surfaces are protected by fireclay linings, and there is a projecting back. The grate can be converted into ordinary or slow combustion by use of a regulator.

C. B. N. Snewin & Sons, Ltd., must be proud of their display of mahogany, wainscot, walnut, teak, whitewood, deal and timber. Many countries were laid under contribution to supply them. They provide all descriptions of thoroughly seasoned hard and soft woods used in building, joinery, cabinet-making, shipbuilding, &c. There is a fine piece of sequoia running from floor to ceiling and with a width of 51 inches.

There is a refreshing breeziness about the stall of *James Stott & Co.*, due to the active working of several ventilating fans. The powers of the various ventilating appliances cannot hardly be tested in this way. The exhibits are brilliantly illuminated by the numerous burners of the company.

MATHER & PLATT, Ltd.
ENGINEERS,

Park Works, Newton Heath, **MANCHESTER.**

Queen Anne's Chambers, Westminster, **LONDON.**

The manufactures of the *Limmer Asphalt Paving Company, Ltd.*, have recently been increased by Bishop's patent non-slipping stair treads. They are constructed of a steel frame enclosing three sides, with an apron piece rivetted to the front. An interlacing steel wirework is threaded through, and then melted mineral rock asphalt is run in to a thickness of three-quarters of an inch. When applied to worn stone steps the uneven surfaces are filled in with Portland cement, and the tread is pressed into position while the cement is plastic. The Lithofalt mastic paving (another rather recent departure) is a cheaper form of mineral rock mastic asphalt. A sectional model of a stable has a flat roof of two coats of mineral rock mastic roofing which has long been associated with this company. Its special use is for laying in playgrounds, mills, schools and similar places. We may in conclusion note that the new address of the Limmer Asphalt Paving Company is 8 Fowke's Buildings, Great Tower Street, E.C.

The roofing tiles of the *Nostell Brick and Tile Works*, near Wakefield, may be selected for particular notice on their stand. They are very hard burnt tiles of dark colour which weather well and do not vegetate. They would make an excellent contrast in a house constructed of cherry-red bricks or with a stucco gable. The tiles have been placed as a covering over the stand of the British Compoboard Company, Ltd. Their blue and brindle bricks are also deserving of attention.

Messrs. Powers & Deane, Ransome's, Ltd., are able to illustrate much of their work on a small scale. As constructional engineers they keep in stock roof principals, stanchions, girders, &c., in their various forms. Sections of two compound girders built up of the largest and smallest section rolled steel joists ever rolled are shown. The floor is of tiles and joists with concrete filling and patent impervious paving over.

The relief decorations for ceilings, walls and other ornamental purposes make the stand of *Messrs. Geo. Jackson & Son* a special feature of the minor hall. The gilded carton-pierre wall lights bear a close resemblance to metal. The ceiling bands are made in fibrous plaster, but the flowers are frequently in carton-pierre, as it gives a better undercut. Chimneypieces, festoons of flowers, panels, &c., all show the spirit of the old work and lack none of its delicate beauty. Their new plaster stone is on the principles already extensively employed on the Continent, and especially in Paris. A column, capital, cornice, wall panel, &c., prove its effectiveness. Stanchions, iron columns, &c., can be rendered things of beauty when encased in the stone. A photograph is shown of the famous plaster roof of Kilmainham Hospital, near Dublin, which was renewed by George Jackson & Son a few years ago under the superintendence of Sir Thomas Drew, R.H.A.

Paints, colours, varnishes in many varieties are exhibited by *Messrs. Walter Carson & Sons*. A case is filled with trays containing raw materials. "Muraline" is sold in a dry powder which is made into a washable paint by the addition of an equal weight of cold water.

No. 100 verandah is a new design in architectural iron-work by *Messrs. Cakebread, Robey & Co.* It is supplied ready for fixing with the requisite bolts and nuts. Their leaded lights and stained glass for domestic and ecclesiastical purposes, as represented by photographs, prove the skill of the company in quite another line. The architects who have shown confidence in their work include such well-known names as Mr. J. L. Pearson and Sir A. W. Blomfield. As builders' merchants, manufacturers and wholesale ironmongers they have a very varied display, which includes ranges, stoves, baths, wrought-iron grates, lavatories, wall-papers, &c.

There is a charm about art metal work which appeals to most people. The *Bostwick Company's* display is illustrative of the freedom which is exercised by designers, whether in brackets, electric fittings, chandeliers, grilles, balustrading, or the other necessary things which are now made beautiful. The company manufacture collapsible gates and shutters, staircase and lift enclosures, lifts and other work.

James Oakes & Co. have on view a few 3-inch Stanford jointed pipes, of which 50,000 were recently supplied to the West Ham Corporation. A representative collection has been made of their salt-glazed ware, briquette fireplaces, tiles, bricks, fireclay goods and other manufactures.

The claims of *Messrs. Vincent Brooks, Day & Son, Ltd.*, for their "True-Scale" photo-litho are sufficiently indicated by the name. The single exception in which perfect accuracy cannot be guaranteed is when tracing cloth is used, as the material is so extremely susceptible to

atmospheric moisture. Although the price of the first copy is comparatively high, the succeeding copies compensate for this. Black and brown printing inks are used. Drawings on Whatman's paper, &c., and canvas can be reproduced. Special black line and sepia copies can be made from subjects on drawing paper or thin cards. They also employ other sun-copying methods. Expedition is made one of the boasts of the company, and orders received in the morning are usually completed the same day.

Compoboard is shown by the *British Compoboard Co., Ltd.*, in the raw material, as well as distempered and finished off as a dado. There are pieces of it 4 feet wide and 18 feet long. The specimens given away suggest its applicability for ceilings, partitions, cubicles and general decorative purposes. A suggestive use is dividing the material into panels by means of narrow fillets or mouldings which cover the joints. It has the appearance of a plastered interior. Where speed construction is essential the material is most desirable, as it can be easily fixed, and papered, painted or distempered immediately after.

Square-turning is seen at its highest point of excellence in the stand of *Messrs. Jones & Leach*, Newtown, North Wales. Their square-cut newels and balusters are made on a new principle, by which the faces are finished exactly

square and the moulds cut clean, with perfect intersection of mitres. The newels are made furthermore to harmonise in character with the balusters. Architects who so desire it can have the woodwork executed to their own special designs.

Messrs. G. & A. Brown, Ltd., 167 Hammersmith Road, W., are well qualified to work their ceilings in the Adam style, for they have been established for more than a century. Their Stand No. 21, in the gallery bays, has two mantelpieces and a ceiling executed with the greatest delicacy and in a manner which brings no disrespect to the great name of Adam. In addition, the exhibit includes cornices, friezes, mouldings, doorways and everything else required for architectural interior decorations. The limitations of a temporary exhibit are great, and we would advise architects to apply for a catalogue, which, by means of photographic illustrations, suggests the skill and capacity of this old-established firm, whose work is marked by the refinement which is necessary in treating Italian detail.

The "Reliance" lead and bitumen damp-course is manufactured by *Messrs. Watson & Co.*, of lead embedded on each side in a layer of bitumen and with outer surfaces of asphalted felt. Bitumen was recognised over 5,000 years ago as a preservative material by the Egyptians, who used bitumen bandages as a covering for their mummies. Consequently it may safely be predicted that the lead and bitumen damp-course will outlast any building in which it

is used. The practical test of placing the damp-course between bricks, the lower of which are soaked in water, is ample demonstration of the suitability of the material for employment on damp foundations. It is sold in 15-yard lengths and up to 3 feet in width. Watson's "Standard" asphalte is intended principally for cavity, vertical and insertion work. A ton will cover 50 square yards half an inch thick, at a cost of under 2½d. a square foot for material.

Martin's Patents Company, Ltd., in addition to displaying their "Unique" reversible window-sash, show the "Quadrant" door springs, which may be fitted to double or single action doors. It consists of a circular brass tube, with a slot containing a powerful spring. On the top of the door is a push. When the door is opened the push presses against the spring, and when the door is released it automatically swings to again. It allows the door to open to its full width, and makes the cutting away of floors unnecessary. The springs can be fixed in two hours.

A very effective white oak drawing-room mantelpiece, and another for a drawing-room, are shown at Stand 70A by the *Parkstone Steam Joinery Co.*, Upper Parkstone, Dorset. In addition to domestic work they manufacture joinery for churches, banks, shops, public libraries, offices, &c. Their specialty is, however, mantelpieces and overmantels of every description. They will send workmen anywhere to repair, alter or match existing work or to fix their own.

Messrs. H. E. Gaze, Ltd., have made a representative selection of their "Oxylin" fibrous plaster decorations. The numerous cornices, some of which are very elaborate, are especially noteworthy, as well as the handsome overdoors. They are supplied ready for fixing, or the fixing will be undertaken by the company. A quarter of a complete ceiling is shown, which gives an excellent idea of the richness which can be imparted to a room. The ceilings are screwed direct to joists, thereby obviating the necessity for lath and plasterwork.

The attractive powers and interest of the *Durolite* exhibit (to which we have already made acknowledgment) are heightened by the presence of windows by *The Amhurst Building, Joinery and Patent Frame Syndicate, Ltd.* The company have placed on the market further means of escaping from the inconvenience and serious danger of the ordinary sash window. Four or two weights may be used

as preferred. The hinged beading allows the sashes to be taken down with the utmost ease. An adaptation of the same idea allows of a casement window to swing inwards when it is necessary to clean it. The lower sash can be left open for ventilation at the meeting rails.

The *London and Brighton Brick, Tile and Terra-cotta Company, Ltd.*, Crowhurst, Lingfield, show in Bay 14 a partition brick which is so moulded that it is keyed with a series of dowels and joggles that bind it with other bricks so firmly as the whole to constitute practically one slab. The bricks are thus introduced into outside walls, taking all weight off the floors. The bricks are keyed for plastering or made smooth for pointing or colour-washing. It is quite suitable for outside work, being entirely weatherproof; also for filling-in between half-timber work, being of a light weight—20 yards super weigh only 16 cwts. The same construction is applied to fireproof lintels, which are threaded into steel joists after fixing. All ordinary requirements in this branch of building construction are met by the company.

The *Armorduct Manufacturing Co., Ltd.*, are justly proud of the list which they can point to of installations where the "Armorduct" improved steel conduit has been employed. A few of the principal are the Coliseum, Haymarket and Waldorf Theatres, London County Council tramcar sheds, and Manchester Ship Canal new transit sheds. They show "Armorduct" conduits and fittings, wires and cables, wiremen's sundries and electric-light fittings, making a special feature of their patent "Knock-out" junction boxes. Thin metal films are cast into the box which can be easily knocked out, and the conduit is secured in the hole by a lock-nut inside and out (or one side only); to insure a mechanical fit rectangular faces are provided.

Slag-wool has for some time been manufactured by *Messrs. Fred Jones & Co.*, and adapted by them to many purposes of construction. It is made up into various sheets and block forms for application to different surfaces. They also show samples of fireproof partitions and fibrous and fire-resisting slabs.

Three mantelpieces shown by *Strange & Sons*, the Holly Bank Joinery Works, Tunbridge Wells, prove how effective a simple design can be made. They have executed work for many of the leading architects.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BOLSOVER.—May 31.—Plans for three schools. Particulars from Mr. G. H. Widows, County Education Offices, Derby.

HARROGATE.—May 24.—For proposed Primitive Methodist orphanage at Harrogate. Conditions may be obtained from Rev. J. T. Barkby, Riche Mont, Harrogate.

HIGH WYCOMBE.—May 31.—Secondary school, accommodation for 175 pupils. No premium offered. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, High Wycombe.

PERTH.—Aug. 1.—Plans for (1) reconstruction of the existing city hall at a cost not exceeding 6,000*l.*, and (2) erection of a new hall at a cost not exceeding 15,000*l.* Premiums will be awarded authors of plans placed first, second and third in order of merit as follows:—(1) For reconstruction, 30, 20 and 10 guineas respectively; (2) for a new hall, 50, 30 and 20 guineas respectively. Instructions, general conditions and plan of site from Mr. John Begg, town clerk.

ROCHESTER.—May 15.—For the erection of a municipal technical institute at Rochester. Three premiums of 50, 20 and 10 guineas will be awarded. Copies of the instructions and a plan of the site can be had from Mr. W. Banks, surveyor, Guildhall, Rochester.

CONTRACTS OPEN.

ABERAVON.—For the restoration of the parapet walls and other work to the tower of St. Mary's Church, Aberavon. Mr. J. A. James, architect, Port Talbot.

ALDEBURGH.—May 24.—For the construction of a new engine-house at the well near Aldeburgh Hall Farm, Suffolk, together with about 870 lineal yards of cast-iron pipes, 6-inch diameter, from the engine-house to the existing water-tower, including valve chambers, machinery foundations and other works. Messrs. James Mansergh & Sons, 5 Victoria Street, Westminster.

ALNWICK.—May 13.—For proposed new infirmary at Alnwick. Messrs. Boyd & Groves, architects, Emmerson Chambers, Newcastle-on-Tyne.

ASTON MANOR.—May 26.—For the construction of a urinal over the Hockley brook. Borough Surveyor, Council House, Aston Manor.

BARROW-IN-FURNESS.—May 15.—For the construction of a steel road bridge over the Walney Channel, uniting Barrow Island and Walney Island; the bridge will consist of eight fixed girder spans and one opening span, on cylinder foundations. Sir Benjamin Baker, 2 Queen Square Place, Queen Anne's Mansions, Westminster.

WARLINGHAM.—May 23.—For the following works to be done at the hospital, Warlingham, Surrey:—(Contract No. 1) erection of cricket pavilion, cart-sheds, shelters, iron fencing, sundry fittings, &c.; (2) erection of about a quarter of a mile of oak pale fencing. Mr. Geo. F. Carter, borough engineer, Town Hall, Croydon.

WESTON-SUPER-MARE.—May 13.—For the erection of a new girls' school, Locking Road, Weston-super-Mare, Somerset. Messrs. Hans F. Price & William Jane and Messrs. S. J. Wilde & Fry, architects, Weston-super-Mare.

WIGAN.—May 20.—For the erection of thirteen cottages in Spring Gardens. The Borough Engineer, King Street West.

WIVENHOE.—June 5.—For alterations and repairs to the Board school, Wivenhoe, Essex. Mr. F. Whitmore, county architect, Duke Street, Chelmsford.

An inquiry was held at the Southport town hall by Mr. A. A. G. Malet, M.Inst.C.E., and Mr. H. Timbrell Bulstrode, M.A., M.D., into an application by the Town Council for power to borrow 35,000l. for the purposes of sewage disposal. It was now proposed to construct works capable of dealing with 18,000,000 gallons of sewage per day—nine times the volume of the present dry weather flow; there would be six pumps (two of them stand-bys), a series of detritus and sedimentation tanks and fifteen filter beds, and the effluent could then be turned into the channel at all states of the tide, except on the highest tides of the year. Evidence was given by Mr. R. P. Hirst, the borough engineer, and Mr. G. Chatterton, engineer, and others.

CORRESPONDENCE.

Re Building Trades Exhibition.

SIR,—We thank you for your notice of our exhibit at Building Trades Exhibition at the Agricultural Hall in our issue of the 5th inst., but at the same time trust you will pardon us pointing out to you that it conveys the impression to your readers that the whole of the work exhibited on our stand was of foreign production. This is not so, as although a great deal of our oak panelling and joinery work is of Austrian origin, we make a large quantity in our own workshops situate No. 8 Berners Mews, and our art metal-work, of which we exhibited a varied selection, was, with one exception, made in our own smithy at No. 13 Berners Mews, where the work can at any time be seen in course of manufacture. We would therefore ask you to be good enough to honour us by a correction of your notice, especially as just at this moment so much discussion is on hand as to the advantages and disadvantages of protection.

Personally we should be only too pleased to make the whole of our oak panelling and joinery in England if the British workmen would only buckle to and produce it at a price which will compete with those of our Austrian friends. They can afford to pack and pay carriage on it for several hundreds of miles, and yet sell work of the best execution in London at a lower rate than it can be produced here.

Another point which we should much like to lay before our numerous readers is that half our business consists in exporting English goods to the Continent. We export largely English tiles, silks, fabrics, sanitary appliances, &c., for which we hold some very important agencies. This is rapidly increasing department of our business, and for the development of this branch we have our own show-rooms

and offices in Vienna, together with agents in Amsterdam, Breslau, Berlin, Budapesth and Turin.

We are sorry to have troubled you at such length, but feel sure, in justice to ourselves, you will not hesitate to lay these facts before the readers of your valuable and widely circulated journal, in order that a somewhat erroneous impression as to the nature of our business should be eradicated.—We are, Sir, yours faithfully,

HÖFLER, LIMITED.

A. G. LEE, Managing Director.

[We have much pleasure in publishing Messrs. Höfler's letter.—Ed.]

NEW CATALOGUE.

WHEN Messrs. Mellowes & Co., Ltd., undertook the contract for glazing 100,000 superficial feet at the Crystal Palace, Sydenham, we drew attention to their work on that historic building. It might be supposed that Paxton's roof was perfect, and it was a wonderful feat in 1853, but all frequenters of the building must acknowledge that the interior has been since the change more satisfactory than formerly. The confidence of the contractors in their work was shown by their undertaking to keep it in order for ten years at their own expense. The company are supposed to have saved 800l. a year by the new work. The latest catalogue shows the application of the system to roofs however large, and whether laid out on straight lines or on curves. It is adapted, as we see from the illustrations, not only for immense railway stations, but for arcades, works, conservatories, and, in fact, all structures where glazed roofs are a necessity. The roofs have been employed not only by English, Scottish and Irish railway companies, but by the two great railway companies who own the western and northern systems in France. In London alone the system is exemplified in over a thousand examples. The endurance of Messrs. Mellowes's roofs is due to the use of a tin-lead metal which is unaffected by atmospheric action and by the water-tight condition which is ensured; snow or rain cannot find its way between the glass and the woodwork. There is no breakage from expansion or contraction. The catalogue will be interesting from the numerous photographs of roofs, some of which have been laid out on artistic lines.

8 BRADFORD AVENUE, LONDON, E.C.

TRADE NOTES.

A NEW clock has just been erected in the parish church, Stockland, Somerset, by John Smith & Sons, Midland Clock Works, Derby. It shows time on one dial, strikes the hours and chimes the quarters. It was made generally to the designs of the late Lord Grimthorpe.

THE numerous customers of Messrs. Hahn & Co. will be pleased to learn that the firm has secured the Alexander Dock, almost adjoining the tidal-basin station at the Victoria Docks. As the wharf has an area of 140,000 square feet they will be able to adequately display their valuable stock of seasoned foreign hardwoods. The wharf has also the advantage of enabling the firm to rapidly carry out, either by rail or by water, all orders which are entrusted to them.

BUILDING AND BUILDERS.

THE Doncaster Rural District Council have approved the amended scheme prepared by Messrs. Balfour & Son for sewerage and sewage disposal at Bentley with Arksey, and it was resolved that application be made to the Local Government Board for their sanction to a loan of 11,500*l.* for the purpose.

BLOOMSBURY CHAPEL has been renovated and decorated throughout, and new seating of pitch pine put in on a semi-circular plan on ground floor, and new seating also in the galleries. Pulpit and choir seats have been altered. The renovation has been carried out by Messrs. Higgs & Hill, Ltd., from designs by and under the superintendence of Messrs. George Baines & Son, architects, 5 Clement's Inn, Strand, W.C.

MESSRS. ROBERT NEILL & Sons, Manchester, have, it is understood, signed the contract for the erection of municipal buildings at South Shields, at a cost of 47,000*l.* It is desired that a start should be made at once, but there may be difficulties in the way if the dispute in the Tyneside building trade continues. Mr. Ernest E. Fetch, 26 John Street, Adelphi, W.C., is the architect.

THE Scottish Building Trades Federation at their last half-yearly meeting at Inverness discussed a letter from the National Federation of Great Britain suggesting that

builders working outside their own district should be required to become members of any allied association existing in the locality of their work, and to conform to the rules and wages. The question will come up for full consideration at next meeting, which is to be held in business in the autumn.

THE Aston Board of Guardians have approved the plans and estimates of the proposed new buildings. These include a new pavilion, half-pavilion and places of worship for the Roman Catholics and Protestants. The estimates were:—New pavilion, 10,410*l.*; half-pavilion, 3,550*l.*; Roman Catholic chapel, 200*l.*; Protestant chapel, 2,560*l.*; architect and clerk of works, 850*l.* and 200*l.*; quantity surveyor, 200*l.*; furniture, 1,000*l.*; contingencies, 500*l.*—a total of 19,500*l.*

THE finance committee of the Holborn Town Council has considered the question of requiring deposits on applications for tender forms for the annual and other contracts. In the opinion of the committee these deposits are too small to be any guarantee as to the solvency of the firms tendering, and having regard to the recent remarks of Mr. Justice Jelf at the Central Criminal Court, the committee recommends "that in future no deposit be required as the condition for tendering in connection with any contracts with the Council."

MESSRS. VICKERS, SON & MAXIM have just let contracts for extensions of their works at Barrow. A new shipyard is being constructed on which a ship 1,000 feet in length can be built. This will be enclosed in a glass-roofed building, with powerful electric travelling cranes over the whole length. The firm is also constructing a new pier in Buccleuch Dock, Barrow, at which the largest ships can be equipped with machinery. Alongside this pier a 150-ton electric crane will be built. The entrance to the Buccleuch Dock also is to be enlarged, and when this is finished ships 1,000 feet long, 100 feet in width and 32 feet draught can be docked.

AN electrical exhibition will be held at Olympia from September 25 to October 21, 1905, inclusive, under the auspices of the National Electrical Manufacturers' Association (Incorporated). Sir William H. Preece is the president and Mr. Walter Davenport the secretary.

TO BOROUGH ENGINEERS, SURVEYORS, ARCHITECTS,

Hassall's Patent Water Closet.

AWARDED THE MEDAL OF THE SANITARY INSTITUTE, 1902.

IMPORTANT IMPROVEMENT IN FLUSH-DOWN W.C.'s.

C. W. OUTRAM & CO. WOODVILLE, near Burton-on-Trent

Telegraphic Address, "OUTRAM, WOODVILLE."

Excelsior and Rawdon Potteries,

ELECTRIC NOTES.

Rawtenstall Corporation will obtain a supply of electricity for use in the borough from the Lancashire Electric Power Company for a period of five years, in accordance with the terms of a draft agreement. The scheme now only awaits the approval of the Board of directors.

COLONEL A. J. HEPPER, Local Government Board inspector, held an inquiry at the Burton-upon-Trent town hall concerning the application of the Town Council to borrow £3587 for electric-light extension and the enlargement of the town hall, and to replace 6,000 ft. excess of expenditure already incurred on behalf of the electric lighting.

The British Consul at Rosario, Mr. H. M. Mallet, in his report for 1904, states that there is a good opening in his district for electric plant and appliances. At the present time foreigners alone are supplying almost all requirements in this line. Of seventy electric motors, representing 226 horse-power, that have been installed in the town during the past eighteen months, one only was of British origin. Great Britain contributes the greatest value of exports.

The directors of the Dundee and Broughty Ferry Tramway Company have served notice for the commencement of the contract on Messrs. White, the contractors. As has already been stated, the contract price is over 80,000 ft. There will be 5½ miles of road, equivalent to 9¾ miles of single track. The overhead work is to consist chiefly of trolley arms, the trolley wires being 21 feet from the ground. The power station is to be a brick structure, with a chimney-stalk 110 feet high. The plant will consist of 100-k.w. railway generators, with high-speed engines. The car shed is also to be a brick structure, 175 feet long and 55 feet wide.

The Derby Town Council have agreed to accept the tenders of the St. Helens Cable Company, Ltd., for the supply of feeder cable (860 ft. 17s. 1d.) and distributing bitumen cable (438 ft. 12s. 6d.); those of Messrs. S. R. Turner & Co., Ltd., for the supply of lathe (38 ft. 0s. 6d.), and a pillar drilling machine (34 ft. 2s. 6d.); and those of Messrs. C. A. Parsons & Co., Ltd., for the supply of a steam turbine

(3,950 ft.), and the British Thomson-Houston Company for switchboard extension (287 ft.).

THE Durham Collieries Electric Power Company, Ltd. (chairman, Sir Douglas Fox), have arranged a contract for the supply of power to the important collieries in the county of Durham belonging to the Hetton Coal Company, Ltd., whose chairman is Sir Lindsay Wood, Bart. It is proposed to use the power for hauling, pumping, coal cutting, lighting, &c., at the company's extensive collieries at Eppleton, Lyons and Elemore. The power company are also to supply the extensive collieries of the Lambton Collieries, Ltd., as well as the estate of the Earl of Durham. A large power station has just been started to be erected on 55 acres of land at Philadelphia, near Penshaw, which will supply at least twelve collieries and also the 15 miles of tramways belonging to the Sunderland District Electric Tramways, Ltd., as well as the lighting of the urban districts of Houghton-le-Spring and Hetton-le-Hole, and the extensive district embraced in the area of the Easington Rural Council owned by the Houghton-le-Spring and District Electric Lighting Company. The contracts have been arranged by Messrs. Harper Bros. & Co., consulting engineers, London, and Messrs. D. Balfour & Son, engineers, Newcastle-on-Tyne.

THE refuse disposal works erected by the Town Council of Ayr on a site adjoining the Corporation electricity works in Mill Street have been formally opened. The cost of the site for the destructor works was about 2,500 ft., and the cost of the plant was 10,750 ft. The type of destructor is Meldrum's patent hand-fed simplex regenerative, with six cells, each measuring 25 square feet grate area. The boiler is a Babcock & Wilcox water-tube with 2,852 square feet heating surface, and the capacity of the destructor is 60 tons refuse per day of 24 hours. At present it is being worked in two shifts of eight hours each, and the refuse dealt with is about 31 tons per day. In connection with the destructor is a clinker crushing plant, capable of crushing, elevating and screening about 4 tons per hour, the motive-power being 25 h.p. electric motor. The clinkers are broken into four sizes, and are mostly disposed of for cement concrete and sewage filtering purposes. The steam generated in the boiler is partly used for the force blast, but the bulk of it is

passed on to the electricity works, and the price to be paid by the electricity department to the cleansing department has at present been fixed at 450*l.* per annum. The whole works were carried out under the direction of Mr. John Young, town surveyor.

VARIETIES.

Mr. F. H. BAKER, architect and surveyor, of 21 Liverpool Street, has taken into partnership Mr. W. H. Wrightson. The practice will be carried on in future as Baker & Wrightson.

The Hawarden Council will make application to the Local Government Board to rescind the loan of 20,800*l.* already sanctioned for the sewerage and sewage-disposal works for Hawarden special drainage district and apply for sanction to borrow 21,000*l.* for thirty years.

The Perth Town Council on Monday agreed to borrow 1,250*l.* for the cost of erecting buildings in Gowrie Street, 12,000*l.* for the erection of the isolation hospital, and 180*l.* for sewers in King Edward Street and the new street off Craigie Road.

The Local Government Board has refused to sanction the application of the Woolwich Borough Council for powers to acquire land compulsorily at Bostal Hill for the purposes of a municipal housing scheme, which was estimated to cost 106,000*l.* It is surmised that the site has been objected to.

JUDGE EMDEN, having made numerous fruitless complaints about the unsuitability of the town hall at Tunbridge Wells as a court of justice, decided not to hear any important cases there. As a result, litigants have been obliged to go to the Tonbridge court. The Town Council propose to erect a new court-house at a cost of 4,000*l.*

The Manchester Ship Canal Company have given official notice that they propose to construct at the tidal opening at the Weaver mouth an embankment of earth or clay 206 yards in length, 2 yards in average height, 18 yards in width at the base and 16½ yards in width at the top, the object of the embankment being to prevent the escape of water from the Manchester Ship Canal into the estuary of the Mersey.

The Paisley Town Council on Tuesday considered a letter intimating a gift of 10,000*l.* for a much needed improvement in the town in the removal of a large block of buildings at Paisley Cross so as to relieve existing congestion. The Council have hitherto been prevented from effecting improvement by want of funds.

The Wellman-Seaver-Morgan Company, of Cleveland, Ohio, are, it is said, preparing plans and estimates for construction of an extensive iron and steel plant in N. South Wales at a cost of about 3,000,000 dols. The South Wales Government have made the company a position for the work.

A scheme for the extension and development of harbour and works of Trieste has been drawn up, according to the estimate an expenditure of 712,000*l.* needed for the completion of works already in hand. Other proposed harbour works, such as the enlargement of existing jetties and the construction of new ones, a sum of 1,383,000*l.* is set down, so that the total estimates for harbour works amount to 2,095,000*l.* Over and above this a sum of 125,000*l.* is to be expended on harbour equipment.

The Hollymoor lunatic asylum was opened on the 6th inst. by the Lord Mayor of Birmingham. The site contains about 120 acres, and the buildings comprise patients' blocks and administrative buildings, including spacious dining and recreation-hall, engine and boiler-house, laundry, bakehouse and workshops, a chapel, homes for attendants, nurses and servants, with dining and recreation rooms. The present accommodation is for 604 patients. The plans were prepared by Messrs. Martin & Martin, Birmingham. The contract was commenced in April 1901 by Messrs. J. Bowen & Sons.

The Middlesex County Council have decided to appoint a committee to confer with the neighbouring county councils with a view to the preparation of a scheme, thought desirable, to widen all the main roads leading out of London into Middlesex to a width sufficient to accommodate the great and increasing vehicular traffic, including the tramways or light railways and motor-cars, with wide footways for pedestrians, before these main roads are further encroached upon by building operations, or, where more expedient and economical, to provide similar new routes.

THE GAIETY RESTAURANT.

The Gaiety Theatre has been open since October 1903, and the palatial building connected with it, which is to be used as a restaurant on a grand scale and for residential chambers, was not completed until Wednesday. On the suggestion of Mr. Norman Shaw, R.A., the architects, Messrs. Ernest Rüntz & Ford, adopted a Florentine type of Renaissance in their design, and the massive treatment has many advantages in such a position. The whole of the façades are executed in Portland stone, and the cornice, raised at a height of 80 feet, is the largest in London, below which is the ornamental frieze, the work of Mr. Hibbert Binney, of which illustrations have appeared in *The Architect*.

The main entrance is from the Strand by a columniated portico surrounded by a broken pediment; there is also another entrance near the Strand in the Garden Thoroughfare, along the greater portion of which on the mezzanine level is a projecting balcony. The area covered by the restaurant consists of 10,450 square feet, having three frontages of 370 feet in all to the Strand, Aldwych, and 10 feet Garden Thoroughfares, thus insuring a maximum of light and air unusual in similar buildings. Entering from the Strand through the main entrance-hall, a broad flight of steps leads to the joint-room in the lower level; this room is 60 feet in length, 40 feet in width and 17 feet in height. It is panelled throughout in enamelled wood with a green and gold frieze over, carpeted and upholstered in a green tint and fitted with tip-up seats of the Gaiety stalls pattern and alcoves around.

The "Adams" banqueting-hall is 45 feet in length and 30 feet in breadth, and the whole of the detail throughout is in the style of the period which gives it its title. The colour scheme here is white and green, the carpets and curtains of the richest materials, and every facility for quick service that could be devised has been carried out.

Three private dining-rooms adjoin facing the Strand, named respectively the "Nelly Farren," "Kate Vaughan" and "Fred Leslie;" all are choicely decorated and furnished, and suitable for large and small gatherings.

Leaving the mezzanine floor and continuing up the grand staircase we arrive at what is termed the first floor, where many of the apartments run through two storeys, the ceilings being underneath the third floor. Landing in a spacious lounge, as on the lower floors, on the right will be found the Masonic temple and banqueting-hall. Between these is the tiler's room, which is of sufficient dimensions to accommodate a large number of persons. From it on the western side is the entrance to the Masonic temple; the design for which has been based on Byzantine church work. This room is 45 feet in length, 27 feet in height and 26 feet in width, with an apsidal end and barrel roof over (supported on sixteen Sienna scagliola marble columns), richly decorated with emblematical paintings in the semi-dome and on the semicircular end above the organ. The prevailing colour scheme is in rich blues in the carpets, pearl velvet in the draperies, and the whole is adapted for every conceivable branch of the Masonic world.

From the tiler's room we enter the Duke of Connaught banqueting-hall, 27 feet in height, 31 feet in width, 34 feet in length. This hall is carried out entirely in Greek detail, the prevailing tints of decoration being terra-cotta, red and white. There is a separate service from the kitchens devoted to this portion of the building, also special cloak and lavatory accommodation. On this floor also is the Georgian Hall, or ball-room, and the Aldwych Salon, decorated in heliotrope, white and yellow, the former being of similar dimensions to the restaurant proper, namely, 60 feet by 40 feet, with a balcony round. It is believed that the spring floor which has been provided will be found one of the best in London, and the detail throughout is the refined treatment of that already described for the restaurant, the colour scheme being white, yellow and old gold. The niches on the floor level are occupied by suitable bronze statuettes, and a subsidiary staircase is provided for dancers to reach the balcony for sitting out during the intervals of the dances.

On the second floor are three private dining-rooms named respectively the "Carmen," "Esmeralda" and "Monte Cristo" rooms, each furnished in simple but effective taste.

On the third floor we find the suites of residential chambers. These are varied and unique; each suite is self-

London Showrooms—57 HOLBORN VIADUCT, E.C.

To be obtained through Hardware Merchants, Factors, or Wholesale Ironmongers, through whom our New and Revised Catalogue of General Brassfoundry may also be obtained

contained, and consists of entrance hall or lobby, bedroom, sitting-room, bath-room and lavatory. The decorations are varied, being carried out in the Dutch, Queen Anne, Adam, Art Nouveau and the Louis XVI. styles, it having been the endeavour to supply the public with not only a varied but a refined treatment of decoration, and the furnishing throughout has been done in a costly and attractive manner.

The remaining upper floors are devoted to similar residential chambers, whilst the top floor is entirely occupied by the staff dormitories and various offices, including kitchens, beautifully ventilated, amply lighted and with an efficient service to the ballroom and residential parts of the building.

A special feature is made of the two great buffets, the one on the Strand frontage and the other on Aldwych. The former is 36 feet by 26 feet, amply lighted by large semicircular headed windows and decorated in the style of the Georgian period, with polished mahogany, moulded, panelled and carved wainscot, above which are decorative plaster panels with swags of fruit and flowers in the Grinling Gibbons style. Here will be hung portraits of celebrated actors and actresses of the period, taken from those in the National Portrait Gallery. This apartment will be known as the "Georgian Buffet." The buffet on the Aldwych side is a complete contrast, the basis of the design being on Dutch model. This buffet is 44 feet by 22 feet, and is panelled throughout in bass wood, stained green and polished, with Dutch tiles and ornamental pewter-work. The restaurant proper can be reached from this portion of the building without going through the main entrance. The residential chambers can be approached either from the main restaurant entrance or from a separate entrance, which is provided with a lift in Aldwych immediately facing the new Waldorf Theatre.

The lighting, ventilation, &c., have been carefully considered. The sanitary appliances, baths, &c., are of the most approved and modern type, and are supplied by Messrs. Doulton & Co., Ltd., and Messrs. J. Tylor & Co. Ltd., of London.

The electric lifts have been provided and fixed by Messrs. R. Waygood & Co., Ltd., of London.

The architects are Messrs. Ernest Rüntz & Ford, of 10 Walbrook, London, and, in addition to the general

structure, the whole of the decorative work is from the design and the furniture of their selection.

The contractor is Mr. James Carmichael, of War worth; the clerk of the works is Mr. Lett, and the contractor's foreman, Mr. Mackintosh.

THE BUILDING EXHIBITION.

ALTHOUGH the Building Exhibition is now a memory to us, however, we hope will bring many advantages to those whose works were displayed, we have still to bring so many specialties before our readers. One is of a nature which should be one of the first thoughts in a contractor's mind when he undertakes a building. Scaffold accidents have been a boon to lawyers, but they are avoidable if the simple patent flexible galvanised steel wire ladder grips and scaffold lashing are adopted. They can be attached in a minute by any labourer, and will withstand all strains which a scaffold is exposed. Some thousands were used in the immense works in Dublin for Messrs. A. Guinness & Co., Ltd., and not one accident occurred. The worth was also tested in the Savoy hotel extensions, and the new wing of St. Thomas's Hospital. As they are manufactured by the *Bristol Wire Rope Company* there is no dependence on other works for material.

It is often difficult to clean marble, mosaics, tiles, terracotta, for the stuff employed may produce stains which are not readily removed. The Gopso manufactured by the *Gibson Soap Company* is specially adapted for the purpose and has been used in public buildings, clubs, hotels, &c. with success.

Messrs. L. Lewis & Co. were exhibiting their improved patent mastic asphalt damp-course. There are many advantages to be claimed; amongst others, that it is not affected by frost or heat, is always pliable and flexible, will not crack or stick, and is easily fixed. Another important characteristic claimed is that it is not affected by the greatest pressure. Messrs. Lewis have supplied it to the War Office, the Admiralty, London County Council, and to numerous public buildings and institutions, electric works, gas companies, railway companies, &c. The charges are particularly moderate.

Photographs taken in any part of the country at a few hours' notice.

The Shannon Company had a representative exhibit of a well-known system of letter filing and labour-saving devices, also of office furniture, which for finish and excellence of workmanship could not be excelled.

At Stand No. 23 Messrs. A. C. Potter & Co. displayed an artesian well engine which has been specially designed to meet the present-day requirements of high-pressure work. They justifiably call attention to the fact that this engine has been turned out from their works made entirely of British material and by British workmen.

Mr. Jas. Oates had an exhibit at Stand 24 of his patent printing machines for wall-papers, &c., which will be of interest to decorators.

At Stand 25 was found the exhibit made by Mr. H. McKinnell of navy barrows, which were of good workmanship and supplied at a reasonable charge.

Messrs. Kershaw's exhibit at Stand 27 of French polish, spirit varnishes, &c., was of interest to the builder and decorator. The specialty was a new paint remover, which

NEW DESIGNS IN GRATES.

THE Carron Company, as we recently mentioned, have been engaged in preparing a new series of interior grates, &c., made up from eighteenth-century work which was executed at the Carron works from 1780 to 1800 by Henry and William Haworth, who were both students at the Royal Academy during the presidency of the renowned artist, Sir Joshua Reynolds. The original wood-carvings are in the possession of the Carron Company, and are undoubtedly masterpieces of the carvers' art. The adaptation, which the Carron Company hope will be found useful and meet modern requirements, have been specially arranged to suit the architectural profession by Mr. John Kinross, A.R.S.A., Edinburgh, and may now be seen along with suitable tiles at their show-rooms.

The "Shrine" is an especially attractive example of eighteenth-century work, the figure subject being well conceived and carried out. When properly combined with

apparently only requires to be properly made known to have a good sale.

Messrs. H. G. Goodwin & Son at the next stand, No. 28, had an interesting exhibit of joinery.

At Stand No. 30, Messrs. Hunt & Fages exhibited their patent scaffold fixer, which appears to be easy to fix.

Patent sliding and reversible sash windows were shown by Messrs. W. G. L. England.

The two adjacent stalls of the Stoney Lane Brick Co., Ltd., and the Erewash Valley Brick, Pipe and Pottery Co., Ltd., showed somewhat similar goods. The first named confined their attention to blue goods, while the latter included red, blue, buff and terra-cotta.

Sutton & Co., Union Pottery, Overseal, near Ashby-de-la-Zouch, sent many of their patents, including self-centring conduits for electric cables and fixed bridge troughs and other troughs for the same purpose. They likewise manufacture Green's patent Wyvurst channels and Henman's gully channel, as well as many other allied accessories.

suitable tile splays and a chimneypiece in keeping the whole will be found to be in good taste, without being pretentious. The sizes are 21 inches wide by 45 inches high by 14 inches fire; 25 inches wide by 45 inches high by 18 inches fire; 25 inches wide by 40 inches high by 18 inches fire.

REFUSE COLLECTION AND DISPOSAL.*

THE object of the following notes is simply to suggest a few points which appear to the writer to be worthy of discussion, as having a practical bearing on the question of refuse collection and disposal in its most recent aspects.

* A paper read by Mr. William H. Maxwell, A.M.Inst.C.E., borough surveyor and waterworks engineer, Tunbridge Wells, at the Conference of Municipal Engineers on the 5th inst.

In regard to collection, there is perhaps not much that can be said to be new. The most important development in this connection is probably that of the extent to which mechanical haulage can be adopted to advantage. Although the writer is not in a position to-day to place any original figures of comparative cost of mechanical *versus* horse haulage in the work of refuse collection before this meeting, some few years' experience in the mechanical haulage of road metalling into his district from an outlying quarry (some twelve miles distant), owned by the corporation, has confirmed his belief in the advantages of that mode of conveyance where long distances have to be covered; that is, where a definite journey has to be regularly accomplished, with few or no intermediate stoppages, and where the vehicles can be kept in constant use. The work of refuse collection, to the writer's mind, does not present these essentials to the success of mechanical haulage, owing to the great number of stoppages, the comparative shortness of the distances, the attendant loss due to costly vehicles and high-waged drivers standing so long in the streets for purposes of filling the dust-vans, and the difficulty of delivering the vehicles into many of the "shoots" used for the deposit of refuse.

Actual figures, carefully taken by disinterested users over long periods, and including all charges, such as wages, repairs, fuel and depreciation, would be of much service in this connection, now that this form of haulage is being so largely adopted for various commercial purposes.

In the subject of the disposal of refuse interest naturally centres mainly around the most recent features of disposal by the destructor system and the production of motive power therefrom, and in this connection the following points appear to be of importance at the present time, viz. :—

1. That, having regard to the apparent similarity of results in refuse burning and steam production achieved by several different makes of furnace, the deciding factor between competitive schemes now hinges very largely upon the question of initial capital cost and subsequent annual repairs as judged from existing plants of different types.

2. That more numerous and carefully recorded data are needed for making a reliable comparison of the cost of repairs on different makes of plant.

3. That the best types of destructors now on market are capable of extracting the last unit of heat contained in the refuse, and that future improvements of the destructor system are principally to be looked for the reduction of capital cost; in the fuller interception of heat energy for use during periods of heavy loads at power stations, in the economising of working expenses (including repairs), in the means of feeding and clinking of cells, in the utilisation of residuals, and in the reduction of possible causes of nuisance on the works and in the immediate neighbourhood.

4. That a large proportion of the published "tests" of destructor performances are unreliable, and cannot be accepted as one of the determining factors in the choice between competitive schemes. Fuller data are required as to the composition of the refuse used, its calorific value, percentage of moisture contained therein, &c.

5. That the business of burning refuse in destructors has now assumed a fairly definite form, and that makers are now able in their contracts to give definite and reliable guarantees of performances, such as both users and makers may, with a reasonable degree of certainty, expect fully to realise.

6. That mechanical, or so-called "labour-saving," devices for the handling of the refuse do not always reduce working expenses, and require much caution in regard to the introduction and design.

7. That the recent installation of several large combined destructor and electric stations affords practical proof of the growing confidence in the utility of modern destructors and power producers.

8. That, in the larger combined undertakings, embodying the latest improvements, and having a fair day load (judging from figures already reached over limited periods), the necessary heat value is contained in average refuse, and when this is fully utilised and the main sources of loss eliminated, an average yield approximating to 100 units per ton of refuse burned is attainable.

9. That largely increased capital outlay involved in the utilisation of heat from destructors is not necessarily justifiable in all cases; local circumstances must in every instance be the main determining factor.

THE LONDON VENTILATING STOVE

**Specially Adapted for Hospitals, Infirmaries, &c.
ECONOMISES FUEL. MADE IN TERRA-COTTA.**

A continuous current of fresh air is admitted through a shaft beneath the stove, warmed by contact with the chambers at back, and discharged into the Ward or Dormitory at an agreeable temperature.

In use at the Cambridge Hospital, Aldershot, Bank of England, &c.

SEND FOR PRICES AND PARTICULARS.

JENNINGS' PATENT "DUPLEX" BATH-VALVES FOR HOT AND COLD SUPPLY.

Admitting Cold Water first into Bath, economises Hot, and prevents damage to Bath or injury to Bather. Upwards of 5,000 in use.

JENNINGS' PATENT "BRACKET" CLOSET, adapted for use in Hospitals, Infirmaries, &c.
JENNINGS' PATENT BED-PAN FLUSHING SINK, invaluable in Contagious Disease Hospitals.

INSPECTION OF NEW SHOWROOMS CORDIALLY INVITED.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE
TO THE
ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BOLSOVER.—May 31.—Plans for three schools. Particulars from Mr. G. H. Widows, County Education Offices, Derby.

HARROGATE.—May 24.—For proposed Primitive Methodist orphanage at Harrogate. Conditions may be obtained from Rev. J. T. Barkby, Riche Mont, Harrogate.

HIGH WYCOMBE.—May 31.—Secondary school, accommodation for 175 pupils. No premium offered. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, High Wycombe.

PERTH.—Aug. 1.—Plans for (1) reconstruction of the existing city hall at a cost not exceeding 6,000*l.*, and (2) erection of a new hall at a cost not exceeding 15,000*l.* Premiums will be awarded authors of plans placed first, second and third in order of merit as follows:—(1) For reconstruction, 30, 20 and 10 guineas respectively; (2) for a new hall, 50, 30 and 20 guineas respectively. Instructions, general conditions and plan of site from Mr. John Begg, town clerk.

CONTRACTS OPEN.

ALDEBURGH.—May 24.—For the construction of a new engine-house at the well near Aldeburgh Hall Farm, Suffolk, together with about 870 lineal yards of cast-iron pipes, 6-inch diameter, from the engine-house to the existing water-tower, including valve chambers, machinery foundations and other works. Messrs. James Mansergh & Sons, 5 Victoria Street, Westminster.

ASTON MANOR.—May 26.—For the construction of a urinal over the Hockley brook. Borough Surveyor, Council House, Aston Manor.

AYLESBURY.—May 23.—For repairs and alterations at the union house, for the Guardians. Mr. F. Taylor, surveyor, Temple Street, Aylesbury.

BAILDON.—May 23.—For the erection of a villa residence and appurtenances in West Lane, Baildon (Yorks). Send names to Mr. J. Harper Bakes, architect, Calverley Chambers, Victoria Square, Leeds, before 23rd inst., when bills of quantities will be forwarded.

MAY-OATWAY FIRE ALARM.

WHAT USERS SAY.

Messrs. J. Thomasson & Sons, Spinners, of Bolton, write:—"A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily, 10 minutes before the Automatic Sprinkler went off." Loss £48. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works, Edinburgh, write:—"A fire broke out in our factory during the dinner hour on January 18, 1905, when the May-Oatway installation (put in since our previous fire) saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well." Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.C., Premier, writes:—"This system has been largely adopted in New Zealand, and has given the greatest satisfaction." (The Government are the largest users; protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—"Fire March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss." Claims paid, £10 and £60 respectively. What have you done to limit your loss?

Send for circular, or call and inspect 94 Paul Street, E.C.; Glasgow, Liverpool and Manchester.

147 STRAND, LONDON, W.C. (FIRST FLOOR.)

A DESPATCH has been received at the Foreign Office from the British Commercial Attaché at Berlin enclosing a copy of the new law concerning the construction of canals in Prussia and the improvement of existing waterways. The total cost of the scheme is 16,728,750*l.*, of which 12,537,500*l.* will be the cost of building the canal from the Rhine to the Weser, including the canalisation of the Lippe and various necessary works. A sum of 2,150,000*l.* is granted for the making of a canal for large vessels from Berlin to Stettin; 1,058,750*l.* goes to improving the waterway between the Oder and Vistula and to better a portion of the Warthe; and 312,500*l.* is allowed for the canalisation of part of the Oder, subject to the agreement of certain local public bodies to contribute in respect of interest and loss on working expenses. On the Rhine-Weser Canal and branches a uniform towing system is to be worked by the State.

EXPERIMENTS are being made at Torquay with a model of a floating breakwater. The principle is that storms affect the sea only to a depth of 12 or 15 feet, and that the ordinary breakwater involves an unnecessary expenditure of money. The experiments are being made with a strong frame floated by pontoons on the land side and securely moored. Assuming that a breakwater is needed 1,000 yards long in water 60 feet deep, a frame is made to penetrate to a depth of about 40 feet, and the structure is tilted towards the sea. The frame is moored on both sides by long chains attached to its lowest part, and which lie as nearly parallel to the sea-bed as is practicable, in order to obtain the best holding power. When a sea strikes the frame it works back on its chain as a door works on its hinges, thus lessening the force of the sea, and when the sea is broken the structure floats back to its original position, ready to receive the next sea. On the inner or land side there is a horizontal network, supported by pontoons and fixed to the structure, in order to break any sea that may wash over it.

A COMMITTEE of the House of Lords on Friday last considered and rejected the London Squares and Enclosures (Preservation) Bill, promoted by the London County Council. Lord R. Cecil stated that the County Council ascertained that there were upwards of 400 gardens, squares or enclosures in the county of London, represent-

ing a total area of nearly 400 acres. Except in a very few cases, there was no prohibition against erecting buildings on these squares. The owners of 67 squares, comprising some 40 acres, expressed their approval of the Bill, and the owners of 72 squares did not express any disapproval. About 290 squares or enclosures were struck out of the schedule, and 139 remained in the schedule as it appeared before the committee. On any of the spaces dealt with under the Bill the erection of buildings other than such as might promote the enjoyment of the land would be unlawful. There was a provision against any use of the land for commercial or profit-making purposes, and another provision entitling the owner to call upon the Council to preserve and maintain it as a public open space.

THE GAIETY THEATRE AND RESTAURANT.

IN our notice of last week we should have mentioned that the work carried out in connection with this fine addition to London's hotels and restaurants was a triumph for the various sub-contractors. Particularly does this apply to Messrs. Shoolbred & Co. for the refined and excellent skill shown in the furnishing, and Messrs. Jackson & Sons, of Rathbone Place, W., for the mural decoration. The work shown is a triumph of good taste, and Messrs. Jacksons may well be proud of each and every example of their treatment to be found throughout the building.

The electric fittings are in every way in keeping with the decoration and furnishing. A careful inspection reveals to us that a decided feature has been made of the electric-light fittings. These are too often left to the discretion of the contractor and to take care of themselves, but we are pleased to see in this instance they have been specially designed for their various positions, and we are conscious that perfect harmony pervades the magnificent halls and rooms of this palatial building in consequence.

In these days of the grotesque "l'art nouveau" it is a welcome change to note the influence which old Classical models have had upon the designers of these fittings. Purity of design has been maintained whilst conforming to the

requirements of the present-day mode of lighting of electricity. As instance of this, the fittings in the ball-room and restaurant are worthy of especial mention, beauty of design combined with high-class workmanship, and finished in a rich gold, producing a very beautiful effect. The fittings in the supper-room attached to the ball-room are also eminently adapted to their purpose, silk of a delicate shade being made use of and gracefully decorated in festoons and tassels, the whole giving a very pleasing effect, the softened and subdued light being a welcome change from the brilliance of the ball-room.

Another series of very good designs are the fittings in the rooms allotted to the Masonic fraternity. Here the designer has gone to Roman and Grecian models for his inspiration, and has faithfully preserved the dignity and grace characteristic of those periods without in any way slavishly following the originals; these are finished in very dark bronze, slightly relieved with a suggestion of verdigris, giving a very suitable and effective result. In the Masonic Temple three-light fittings drop gracefully in front of the columns, which are in pairs, a suitable support bracket being fixed between them. In the Masonic Banqueting Hall, in addition to four six-light hanging fittings of Grecian design, there are several wall-lights which take the form of torches, the effect being completed by the addition of flambeaux shades.

In the Strand buffet and in the joint-room we have some fine examples of Flemish designs, the buffet fittings being a particularly smart development of this style. This class of fitting is also utilised for the lighting of the staircases and landings in the form of sconces and chandeliers, these being fitted with patent imitation candles; original models have been followed, and the feeling maintained. Two of these sconce brackets at the entrance to the ball-room, being unique in their massive proportions, are especially worthy of notice.

In the entrance hall we are attracted by the brilliance of the cut glass which has been successfully introduced in the design of these fittings, which admirably suit the existing decorations in the style of François I., their brightness creating a lively impression on entering, and being prophetic of the beauties to be encountered on a closer acquaintance with the interior of this beautiful building.

En passant, mention must be made of the quaint buffet which fronts on Aldwych, which has been treated in a delightfully simple fashion, and is decidedly reminiscent of an old Dutch kitchen. Here again the designer has exercised his ingenuity by producing electric-light fittings in perfect harmony with the rigid simplicity of the decorations, various developments of the old Dutch lantern producing the desired effect.

The remaining positions to be noted are naturally of minor importance, yet the same thoroughness, so noticeable in the principal halls, is maintained throughout. In the various private dining-rooms which are decorated in Louis XV., Louis XVI. and Adam styles, we again have good examples of suitable electric-light fittings.

Turning from the public portion of the building, we notice that in the suites of rooms comprising the hotel special attention has been paid to the decoration thereof; comfort and convenience has been studied and exquisite taste exercised throughout; each suite of rooms has a style of its own, and the electric-light fittings have been designed to suit them, as in the case of the more important part of this building. Even in the passages, corridors, cloak-rooms, &c., we see the same care taken that nothing incongruous shall offend the eye.

On the whole, a more gratifying set of fittings could not be wished, and they reflect the greatest credit on the designers and manufacturers of them—Messrs. William Soutter & Sons, Limited, Birmingham—whose careful attention to detail and sound workmanship has attained this very satisfactory result. It is refreshing to note that we still have craftsmen with us capable of producing high-class work.

One reason for this successful issue may no doubt be attributed to the influence of the architects, whose guiding hands can be traced throughout.

VALUATION OF LICENSED PREMISES.

A PAPER was read by Mr. J. D. Wallis at the Surveyors' Institution on Monday upon the Licensing Act of 1904 as it affects the business of the surveyor. It had been estimated, he said, that 1,200,000l. a year would be leviable

for the compensation fund under the Act, and this sum ought in time to effect a considerable reduction in the number of licenses, but seeing that the amounts to be paid in compensation must be heavy, the change to be wrought was not likely to be a rapid one. The persons claiming compensation would include the freeholder, mortgagee, lessee, sub-lessee and licensee. There was no obligation on them to agree among themselves, yet it seemed that they would have to submit to the compensation authority a sum in writing for approval. The sum was referred to in the Act as an amount agreed on by the persons interested, but the procedure was a novel method of putting forward claims for compensation. The cost of buying out a number of interests in respect of one property was generally in excess of what would be paid to a single claimant. It would not be an easy matter for the compensation authority to decide whether the sum submitted was a reasonable one or not; it was only open to it to accept the amount submitted or to refer the matter to the Commissioners of Inland Revenue, and in the majority of cases the matter would probably be so referred. Any costs incurred by the Commissioners on appeal would be paid out of the amount of the compensation, and this should deter appeals to a considerable extent. The costs of appeal to the High Court would be a serious matter in small cases, and it was the small houses in congested areas which were first being referred for compensation. The question of arriving at the value of licensed premises would be full of difficulty, and unless one assumed that all licenses were precarious the allowance to be made for risk of loss could not be large nor could it be estimated with accuracy. The correct ascertainment of monopoly value would also be difficult, and in many cases a knowledge of the site, with an inspection of the plans of the proposed building, would be the only guide on which to base an estimate of the probable trade. It was not clear whether the surrender of old licenses could be accepted by the justices in satisfaction, in whole or part, of the monopoly value. They had to attach such conditions as they thought best adapted for securing to the public any monopoly value. The monopoly value would be the difference between the value which the premises would bear when licensed and the value when not licensed. His definition of the comparison between com-

pensation value and monopoly value would be that the monopoly value was the value of the license only, whilst the value for compensation was to be the value of the license added to the depreciation in the value of the premises due to the extinction of the license. The general effect of the Act would be that existing on-licenses would be more valuable on account of greater security. They would benefit by reduced competition, following the suppression of rival houses, and by the difficulty of obtaining new licenses. On the other hand the imposition of the annual charge would be a deduction from value. The Act presented many practical difficulties, but he hoped that it would effect some progress towards the solution of a great national question.

IMPROVEMENTS IN THE THEODOLITE.

THE earliest attempt to make a large survey with the aid of an instrument resembling a theodolite was, we believe, in a flat country—Holland or Denmark. At the time the instrument was more allied to the plane table than to the modern theodolite, and, indeed, for a long period the telescope was allowed to have only a comparatively slight elevation above or below the horizontal axis. Such a feat as turning it round in a vertical plane was considered an impossibility. Like most other things, the instrument has gone through a course of development, and if Ramsden were to appear again he would not realise the modern theodolite. It is not only costly, but the use of it requires care, which means time expended in adjustments and calculations, and also in observations. It is only necessary to look at the number of verniers, spirit-levels and screws for a stranger to the use of the instrument to realise how much has to be done and the possibilities of error amidst so many complications. Any improvement or device to save time and insure accuracy is therefore certain to be received with gratitude throughout the world.

A comparison of the woodcuts of the new Dunbar-Scott auxiliary introduced by Messrs. W. F. Stanley & Co., Ltd., with a representation of an ordinary instrument, will at once show there is an addition in the form of a second telescope. It will be observed in both that the addition is parallel to the main telescope, whether it is placed at top or

WORKMEN'S COMPENSATION BILL.

Midland Employers' Mutual Association have a pamphlet on Lord Belper's Bill now before them. The Mutual Association of Employers was formed in Birmingham on the passing of the Act of 1897 for the purposes of indemnifying its members and of dealing with claims from the position of an intermediary. The Association had been eminently successful, it is said, in dealing with the diversified trades of the Midlands and in holding the balance even between a large number of employers and approximately 100,000 workpeople. The basis of the Bill is therefore based on varied and extensive experience.

Concerning the amount of litigation, it has been rightly pointed out (says the Association) that no Act of Parliament can be framed which would furnish definitions sufficiently clear for tests for deciding disputes on question of fact so as to be capable of universal application. It is pointed out, however, that the present provisions have been unsatisfactorily, and have been found to offer a strong temptation to the less scrupulous class of solicitors to bring in vexatious actions under the Employers' Liability Act, or in cases at common law, with the view of driving the employers to settle on advantageous terms. To meet this is an amending section in Lord Belper's Bill, but it is considered "absolutely intelligible." It made clear one point, however—"That a workman who has entered into an agreement as to the amount of compensation, which agreement has been duly registered, in accordance with the Bill, shall be deemed to have taken proceedings under the Bill."

As in the past there has been so much dispute as to what constituted exercise of option, and what facts, such as the receipt of weekly compensation, constitute an agreement, expressed or implied, this amendment of the Bill considers very desirable, adding, "A provision shall be inserted that in case a workman's incapacity is, wholly or in part, any subsequent variation of the weekly payment should be retrospective to the date of such agreement of condition."

The question of the desirability of amendment in relation to the costs of litigation is, says the Association, not yet disposed of under the Bill. It was shown to the Committee that not infrequently some trivial dispute, involv-

ing an issue of only a few pounds, had, by the power now vested in arbitrators under the Act, been permitted to carry costs amounting to four or five times the total compensation secured. "Many such cases," says the Association, "have arisen in our experience, and as an illustration we quote one where the only question was as to the time at which the incapacity of the injured workman had ceased. He admitted that he could have returned to work at the time stated by his employers, up to which date they had paid compensation, but that he refrained from doing so at the instance of his solicitor. He subsequently recovered compensation to the extent of only 32s. more than he had already been paid, viz. up to the date of hearing, and this award carried costs which were ultimately taxed at 14l." There should be introduced, adds the Association, a limitation of costs, following more closely upon the lines of the County Court Acts, and unless in exceptional cases it should be a rule that the maximum costs recoverable should in no case exceed the total of the compensation awarded.

Among other points discussed in the pamphlet are the new proposals concerning the notices of accident and claim for the recovery of damages, the extension of the Act to other industries—one of the most important features of the amending Bill and one generally approved of by the Association—the attempt made under the Bill to mitigate the position of aged and infirm workmen, upon whom the Act of 1897 was undoubtedly prejudicial, the question of the amount payable to minors—a very difficult question—the computation of average weekly earnings, compensation payable in cases of partial incapacity, medical examinations and the duties of medical referees, the paragraph dealing with the cesser of weekly payments where an injured workman ceases to reside in the United Kingdom, and the commutation of weekly payment. In directions other than those touched upon the Bill has several good features. The proposal to sweep away the distinctions as to the height of buildings or depth of quarries which were made by the 1897 Act is an unmixed blessing, doing away, as it will, with what was always felt to be an invidious distinction and fertile source of dispute and litigation. In conclusion, it is said, let it be emphatically pointed out that the one great need in amending the Acts is to provide as far as may be possible an arrangement which will work automatically.

Litigation should be regarded as absolutely the last resource, and not the first, or anywhere near the first, means of settling of claim. For workman and employer to be constantly calling in the aid of the law cannot fail to have a bad effect upon both, and a bad effect, moreover, upon the trade of the country. The main point is for the injured person to receive all the compensation the employer is called upon to pay, without throwing away time in unnecessary delay or money in unnecessary costs.

REBUILDING BALTIMORE.

A RETROSPECT of what Baltimore was a year ago and what it is to-day reveals, says the local *Architects and Builders' Journal*, what may be regarded as a remarkable, if not a wonderful, achievement. On May 1, 1904, the large area of the city's business section lay in ruins, practically untouched since the great conflagration of February 7 and 8. The delay caused by the adjustment of insurance losses, the agitation over the widening of streets and the changing of grades, together with other circumstances, prevented anything like general operations until the beginning of May. During the ensuing twelve months a veritable transformation has taken place. Entire blocks of substantial stores and warehouses have taken the place of the piles of debris, and many of them are occupied by business firms, and trade is going on as it was before the disaster. There are many vacant lots yet to be rebuilt, but gradually these are being cleared to give place to modern structures. In the face of a calamity overwhelming in magnitude, Baltimore merchants, capitalists and business men went pluckily to work to rehabilitate the destroyed section, and what has been already accomplished has evoked praise and admiration from all parts of the country. Trade, which had been temporarily diverted, has been recovered, and the volume of business has more than equalled that of any year in the history of the city. Disastrous as the fire was, it was indirectly a benefit, as it has had the effect of broadening the ideas of our people, and suggested the possibilities for improvements. Not only are the buildings which have been erected more substantial and in many respects more ornate than their predecessors, but as one want creates another, so it has become apparent that other

municipal improvements were required. The consequence of a general sewerage system, the enlargement of public parks, the improvement of the annexe in the western section of the city, are among the projects of the city the Greater Baltimore. For the accomplishment of these works loans aggregating 13,000,000 dols. have been authorised, and these are to be submitted to the vote Tuesday, May 2, for ratification. That they are endorsed is evident from the expression of sentiment on the general desire to see the city develop and attain unprecedented eminence. All this means expansion, expenditure of capital and a steady forward movement to become better, more beautiful and more enterprising and has shown a self-reliance and municipal pride in the face of obstacles which have justly challenged the attention of the world.

FIREPLACES AND SMOKY CHIMNEYS.

At a recent meeting of the Devon and Exeter Architectural Society Mr. E. F. Hooper opened a discussion on "Fireplaces and Smoky Chimneys." He said:—I have prepared a few simple notes to lay before you. We may divide them under many heads, but the most important are:—(1) Badly constructed chimneys in favourable positions, (2) badly constructed chimneys in unfavourable positions, (3) badly constructed fireplaces, well-fires and otherwise, (4) open fireplaces, well-fires and otherwise, (5) bad plans as to windows, doors, &c., (6) stoves, grates, &c., which do not readily draw. To make a badly constructed chimney draw is very troublesome. The owner of a house some while ago spent just 30s. in trying to improve a defective chimney. It was at last set right by a smith, who suggested a plain galvanised sheet-iron pot resembling in shape a letter T, with two pipes at the end, stuck in the ordinary earthenware chimney-pot. A good-built chimney and flue in an unfavourable position—under a hill or high building or near trees—is often a great nuisance. Open fireplaces which include a plain brick or stone opening, with any dog or other grate, seem to be much in request both in town and country. A plain, perforated iron grating is in the bottom, slightly elevated above the surrounding hearth. If these go all right they are

high success, but if not they may well be christened a "smoky evil," for who can remain in a smoky room where the air is being consumed, without having a few tears in his eyes? Well-fires appear to be a matter of opinion. In adapting them to old buildings it is absolutely necessary to carefully examine the surroundings, as frequently the removal of old grates, &c., mouse, rat and other vermin take upon themselves the action of flues, which lead to disastrous results. The matter of planning is sometimes a very difficult one; at others it is very easy. Every site has its good and its bad sides, as also has the client, whose wishes often have to prevail, in spite of the professional knowledge brought to bear against the amateur suggestions. There will have none but large airy flues, while others prefer them as small as possible. I am in favour of the latter, but consider the forming of the "going" above the archway an important one, the size and shape of which must not be lost sight of, especially in ranges and other fires. As regards stoves and grates which do not draw well, perhaps they may be prejudice on our part or owing to bad setting. We are generally convinced that our work is all right, as is the builder also regarding his work.

ELECTRICITY AND STEEL MAKING.

LECTURE was given on Friday before the Manchester Institution of the Society of Chemical Industry by Mr. R. S. Eaton, of the Manchester University, in which he outlined progress which has been made on the Continent during the last two or three years in the application of the electric furnace to the manufacture of steel. At least one important revolution in the steel industry, he said, is likely to undergo a complete revolution. As the new methods aim chiefly at the production of high quality crucible tool steels, in which our own country has always excelled, it is reassuring to find that the revolutionary processes are not of such a nature as to be unsuited for application over here. Owing to the enterprise of the Canadian Government valuable reports have been published of an independent commission set out specially to investigate and criticise the electrical processes of manufacturing steel. The essential novelty of these new methods of manu-

facture lies in the substitution of electric heating for the gas or coke firing which has up to the present been employed in the various stages of treatment which iron has to pass through in the course of its transformation into steel. As a direct result of the application of the electric furnace it has been found possible to turn out steel of a quality at least equal to that of the best Sheffield crucible steels, starting with far less costly materials than those at present utilised. The cause of this possibility lies in the fact that the electric furnace enables the refining of a poor grade steel to be carried to such a high point as to produce a metal of crucible steel grade. This is particularly noticeable in the ease with which phosphorus and sulphur, which are so injurious to the quality of steel, can be eliminated. In present-day practice the crucible steel manufacturer has to select his raw materials most carefully and so mix them that, after fusion in the crucible, they shall have the desired chemical composition and accompanying mechanical properties. On the other hand the Bessemer and open-hearth processes, which are so widely employed for steels of lower grades, do not admit of the refining of the metal up to the quality of a crucible steel. In the electrical processes it is already possible to heat some four tons of metal at a time, and there is no reason why very much larger furnaces should not be constructed so soon as the development shows sufficient promise.

The cost of production in this country, so far as the higher-grade steels are concerned, will certainly be in favour of the new methods. The consumption of electric energy ranges from 718 to 1,100 Board of Trade units per ton, according to the kind of steel manufactured. The relative cost of this energy will be only a small fraction of that which is paid for electric current for lighting or power purposes. In such manufactures as this it is possible to work continuously night and day throughout the year, and under these circumstances electric energy can be generated and sold at prices which are far below what is possible with the very intermittent load of motors or electric lighting. It seems quite probable that in the near future the electric furnace will be considered a necessary adjunct to many of our ordinary steel processes. In this connection it is likely at first to be used chiefly for finishing off the refining of an ordinary steel. It has been shown that even in the

present small plant an ordinary Bessemer steel if transferred in the molten condition to the electric furnace can be brought up to the quality of a crucible steel for the expenditure of only 120 Board of Trade units per ton. The extra cost of this treatment will in any case be only a mere fraction of the enhanced value of the product.

THE WIDNES AND RUNCORN BRIDGE.

The first transporter bridge in this country has been constructed across the Mersey to connect Widnes with Runcorn. There is already a high-level bridge over the river belonging to the London and North-Western Railway Company, but it could only be partially useful. An Act was therefore obtained to construct the new bridge, and the works were commenced about three years ago. According to the *Liverpool Courier* the bridge is precisely similar in design to the ordinary stiffened suspension pattern, with the exception that the approaches are at a low level, thus dispensing with the very costly high-level approaches, and the traffic, both foot and wheel, is carried over in a car suspended to the underside of the bridge. There are only three others in existence, viz. one over the Seine at Rouen, another which crosses the river Nervion, between Portugalete and Las Avenias in Spain, and a third at Bizerta in Tunis. The general construction of these bridges is entirely different from the Widnes and Runcorn bridge, the principle only being the same. It is on the same site as one proposed by Telford, and is of exactly the same span (viz. 1,000 feet between the centres of the towers). This is the longest span of any bridge designed for road traffic in the United Kingdom, exceeding the Clifton Suspension Bridge by nearly 300 feet and the Menai Bridge by 430 feet, while the Conway Suspension Bridge is less than one-third of the length. The bridge is approached on the Runcorn side from Waterloo Road, and on the Widnes side from Mersey Road, the approaches consisting of new roadways at an improved level, nearly flat, built between stone and concrete retaining walls as far as the water's edge. The main towers carrying the cables and the stiffening girder are built, two on the south side of the Manchester Ship Canal and two on the foreshore of the north bank of the

river, and are approached from the above earth approaches by steel elliptical girders resting on cast-iron columns, carrying a corrugated steel flooring, upon which are laid timber blocks on concrete, forming a roadway 35 feet wide between the parapets, the footpaths being 6 feet wide. The roadway in front of the towers is widened out to 70 feet for marshalling the traffic and providing space for waiting-rooms, &c.

The towers are constructed wholly of steel, and stand 190 feet above high-water level, and are bolted firmly to the cast-iron cylinders below. There are four cylinders, 9 feet diameter, under each of the towers. These cylinders are bolted firmly to the solid rock, which is near the surface on the Widnes side, but is about 35 feet below the surface on the Runcorn side. The latter cylinders were sunk by means of compressed air and are filled with strong cement concrete. Each tower consists of four legs, 4 feet 10 inches wide at the base, tapering to 2 feet 3 inches wide at the top, all well braced together with strong horizontal and diagonal bracing. The legs of each tower are spaced 30 feet apart at the base and 6 feet 9 inches apart at the top landing, which is 10 feet 6 inches wide. Each pair of towers are 70 feet apart, and are braced together with strong horizontal and diagonal frames. Upon the top of the towers are fixed the saddles, on steel cables, the rollers being adapted for taking up the variations in the length of the cable due to the loads and the temperature.

Each of the two main cables consists of nineteen steel ropes bound together, each rope being built up of 127 wires, 0.16 inch in diameter, the whole cable thus consisting of 2,413 wires. The diameter of the cable is about one foot. The ends of the cable backstays are anchored into the solid rock about 30 feet from the rock surface, screw adjustment being fixed between the anchorages and the backstays. The weight of the steel cables is about 248 tons, and the wire is capable of withstanding a tensile stress of 95 tons per square inch. The interstices between the wires of the ropes were filled during manufacture with a bituminous compound, and when built up into the cables—the ropes being laid parallel—the whole was covered with the same compound and wrapped with two layers of strong sail cloth saturated with bitumen.

From the main cables are suspended two longitudinal

THOMAS H. BATSTONE begs to notify his clients that in order to accept the Managing Directorship of "Hewetsons" he has resigned his position with his late firm; his vigilant personal supervision will be given to all matters and inquiries at the below-given address.

212 SOLE ADDRESS:
(Opposite Goodge St.)

Tottenham Court Road, London, W.

ing girders 18 feet deep, and placed 35 feet apart ontally, the under side of the girders being 82 feet the level of high water. The two girders are firmly d together horizontally to withstand the wind pressure, is the heaviest stress to which the bridge will be itted. The pressure allowed for in the calculations is board of Trade requirement of 56 lbs. per square foot. e transporter car consists of a platform 55 feet long feet wide, and is suspended from the trolley by steel-ropes, so hung that they prevent at either side or end ation of the car. It is capable of holding at one time two-horse farmers' waggons loaded and 300 passengers, latter being protected from the weather by a glazed er, with folding doors at the ends and sides. On the f the car is fixed the operator's cabin, in which is placed witchboard, so that the operator has a full view of the se and has the car quite at his command. He can se, go ahead, or put on the brakes at a moment's e. The time occupied by the car in crossing will be t two and a quarter minutes, so, allowing the time for ing and unloading, it will be capable of making about or ten trips per hour. The car will be about 12 feet e high-water level, and will clear the Ship Canal wall bout 4 feet 6 inches.

The engineers for the work were Mr. John J. Webster, st.C.E., of Westminster, and Mr. John T. Wood, st.C.E., of Liverpool, the resident engineer being Mr. l. Chase, M.Inst.C.E. The contract for the masonry was o Messrs. W. Thornton & Sons, Liverpool, the contract he steel superstructure being let to Arrol's Bridge and f Company, Glasgow. The whole of the electric instal- and equipment, including the lighting of the structure, een carried out by Messrs. Mather & Platt, of Salford works, Manchester, and the woodwork by Mr. Joseph vlinson, Garston.

TUNNELLING THE DEE.

important piece of engineering work is at present in gress at Aberdeen, where a tunnel is being carried er the river Dee in connection with a new outfall sewer ich is in course of construction. Recently an inspec-

tion of the tunnel, so far as it has been pierced, was made by the members of the Aberdeen Civil Engineers' Associa- tion.

The outfall sewer, which is $3\frac{1}{2}$ miles in length, says the *Glasgow Herald*, intercepts the whole of the drainage of the western part of the city, and at Point Law the sewage is carried under the river Dee in a cast-iron tunnel to Old Torry, and then under Greyhope Road, St. Fittick's Road, and the north foreshore of Nigg Bay to Girdleness Point, where it will be discharged into the sea below low-water mark.

This tunnel will be 114 lineal yards in length, and has been designed to form duplicate inverted syphons, so as to carry the sewage from the outfall sewer on the north to that on the south side of the river by gravitation. The tunnel, which is $8\frac{1}{2}$ feet external diameter and 7 feet 8 inches internal diameter, is formed of rings of cast-iron segments (made by the British Hydraulic Foundry Company, Whiteinch, Glasgow), 18 inches in length, each ring being made up of five segments and a special key piece. The total weight of each ring is $26\frac{1}{2}$ cwt. Each circumferential joint has forty-two 1-inch steel bolts and each longitudinal joint three 1-inch bolts, making a total of sixty for each complete ring. The flanges are machined through-out and are provided with a 1-inch caulking space. Each segment is also tapped for $1\frac{1}{4}$ -inch screw plugs for grouting purposes. The bottom segments and the key piece have cast upon them special machined flanges, 10 inches wide, for the purpose of bolting to them an upright steel diaphragm after the tunnel has been driven. This diaphragm is arranged so as to divide the tunnel into two parts, and thus form the duplicate syphons. It will be built up with $\frac{5}{8}$ -inch steel plate, stiffened every 18 inches by means of rivetted steel angles. The whole diaphragm and the segments will afterwards be lined with concrete, so as to present a smooth surface to the sewage flow. The top of the tunnel is about 20 feet below the bed of the river, or about 41 feet below high-water mark O.S.T. In connection with the dockisation of the river Dee, now being carried out by the Harbour Commissioners, a joint arrangement between them and the Town Council was arrived at for the purpose of constructing permanent quay wall cylinders on both sides of the river, so as to avoid any interference with the tunnel in the future.

MATHER & PLATT, Ltd.
ENGINEERS,

Park Works, Newton Heath, MANCHESTER.

Queen Anne's Chambers, Westminster, LONDON.

These cylinders, which are of concrete faced with granite, form permanent abutments for the tunnel, and were sunk to about the same level and simultaneously with the tunnel shafts. A circular opening, $9\frac{1}{2}$ feet diameter, has been left on each side for the tunnel to pass through, and the space in the Torry cylinder has been filled up solid with concrete at the back of the rings as it was pierced by the tunnel.

At the Point Law and Torry sides of the river 13 feet diameter cast-iron shafts have been sunk. The Point Law shaft has been sunk to a depth of 53 feet, and that at Torry to a depth of $62\frac{1}{2}$ feet below high-water mark O.S.T. These shafts are formed of rings of segments, each ring breaking joint with that below it, seven segments forming a complete ring. After the tunnel has been driven these shafts will receive two $4\frac{1}{2}$ -feet diameter cylinders to connect each half of the tunnel with the syphon inlet and outlet. Over both shafts, above the surface of the ground, valve-houses will be erected, containing the hydraulic cylinders, &c., for controlling the penstocks on the syphon inlets and outlets. At the Torry shaft provision is made for a "sludge" pit and pumping plant and other apparatus will be laid down, worked by electric power, for the purpose of emptying either syphon during cleaning operations. The available fall between the inlets and outlets of the syphons is 16 inches. Considerable difficulty was experienced in sinking both shafts, owing to large inrushes of water, the final operation of plugging the shafts being accomplished by allowing them to fill with water and sending down divers, who deposited 3 to 1 concrete to a depth of 6 feet over the bottom. By adopting this method a thoroughly water-tight plug was obtained.

Owing to the special difficulties that arose in sinking the shafts it was found absolutely necessary, before removing the tunnel junction plates, to make preparations for carrying on the work of tunnelling under air pressure. The strata the tunnel passes through is a very loamy alluvial clay, with thin beds of fine stratified sand, and when exposed to ordinary atmospheric conditions and water often changes into silty mud. The air-compressing plant has been laid down on the Torry side, about 200 yards west of the shaft adjoining the engine and boiler-house of the old Torry Brickworks. There are two Ingersoll-Sergeant horizontal

"straight-line" piston inlet air compressors, with water-jacketed air cylinders and heads, having 16 inches diameter steam and $18\frac{1}{4}$ inches diameter air cylinders, and the machine is capable of supplying 37,800 cubic feet of air per hour to the tunnel.

The hydraulic tunnelling shield (built by Markham & Co., of Chesterfield), is 6 feet $9\frac{1}{4}$ inches long and $8\frac{1}{2}$ inches outside diameter. The shell is composed of $\frac{1}{4}$ -inch steel plates rivetted together. The cutting edge is formed of eighteen steel knives; the diaphragm is double and composed of two $\frac{1}{4}$ -inch steel plates, and has an opening 4 feet 9 inches by 4 feet 2 inches, with a steel chain rivetted on to permit of 4-inch planking being placed across to close up the face. The shield is fitted with six hydraulic rams $6\frac{1}{2}$ inches in diameter, having 22-inch stroke; working pressure is 1 ton per square inch. The rams have forged steel cross-heads.

The backs of all tunnel plates are grouted with Portland cement grout (1 of sand to 1 of cement) by means of a Greathead grouting pan; a small independent air compressor, fixed in the engine-house at the top of the shaft, utilised for this purpose, supplying air under a pressure from 60 to 70 lbs. a square inch for the purpose.

The usual rate of progress made is two rings, or 3 feet a day. The work is carried on by the men working the eight-hour shifts with a break of half an hour in the middle. The air pressure in the tunnel is about 14 lbs. above atmospheric pressure. Electric light is used throughout the tunnel; this assists largely in rendering the air comparatively pure, the average amount of carbon dioxide in the air being from 12 to 14 parts per 10,000 volumes. As far as possible a supply of free air equal to 5,000 cubic feet per hour for each man working in the tunnel is allowed. A medical air lock has been fitted up at the top of the Torry shaft for use in the event of any of the workmen suffering from "bends," i.e. compressed air illness. The first treatment consists of recompression to the tunnel pressure, and then slow decompression over a period extending from half an hour to an hour. Fortunately, owing to the favourable conditions under which the work is carried on, it has not been necessary to use this lock.

The scheme is being carried out under the supervision of Mr G. R. G. Conway.

NEW CATALOGUE.

is often offered as a recommendation of things, that the cost will be saved in a short time. That argument might be brought forward in favour of the wrought-iron bins which are the specialties of Messrs. Farrow & Jackson, Ltd. But everyone who is proud of his wine, as every gentleman ought to be, would say that economy was only one of the least advantages of their system. They have caused a revolution in the wine cellar, for with such fittings it became possible to have dry and clean cellars, and in many cases they will bear comparison with the strong iron bins of banks. Each bottle being kept in position, rolling is impossible, and, we might add, theft is at once detected. Then we find that wine merchants and hotel-keepers make use of Messrs. Farrow & Jackson's bins there can be no doubt about their advantage in private cellars. In every gentleman's house arrangements should be made for the use of those requisites. The firm have also gone a step further, for they now produce refrigerating chambers. Designers of hotels and taverns will find the assistance of Messrs. Farrow & Jackson facilitate the working of those establishments.

TRADE NOTES.

The new union workhouse hospitals, Bury, are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, with descending smoke tubes, Manchester grates and special ventilators.

We have been requested to announce that the Delta Metal Company, Ltd., of London and Birmingham, have removed their registered offices from 110 Cannon Street, London, E.C., to meet the constantly growing demands for their goods, to their new works and offices which they have erected on the riverside at East Greenwich; all communications for the Delta Metal Company, Ltd., should therefore be addressed in future, East Greenwich, London, S.E.

At the Hollymoor asylum, Rubery, Worcestershire—Messrs. Henman & Cooper, of Birmingham, architects—over 6,000 yards of marble mosaic floors have been laid by

Diespeker, Limited. In addition to the flooring they have fixed their curved skirting at the junction of the floor and walls, which does not admit of the collection of any dust, dirt or germs, and makes the floor much easier to cleanse. A twenty years' guarantee was given with this work.

The Fireproof Partition and Spandrel Wall Company of Bank Chambers, Tooley Street, London, write us pointing out that in our notice of their exhibit at the Building Exhibition we stated that in the length of walling exhibited it was supported at each end. This was quite correct, but an error was made in the note by stating that it was also supported in the centre. This latter was a mistake, as in their system there is no necessity for such support, as a perfect rigid spandrel wall was at the Agricultural Hall erected without any intermediate support.

Among the photo-engravers and producers of blocks for business purposes, Messrs. E. Hamel & Co., of Nottingham, are likely to secure a prominent place. They make a specialty of architectural requirements for illustrating, and keep special artists employed retouching and working up photographs and drawings so to reproduce facsimile on copper or zinc the articles or goods, &c. Most of their plant is duplicated in order that work can be turned out quickly. They have spacious daylight studios, and the work being under the direct supervision of Mr. Hamel, who has had years of practical experience both in London and America, they are in a position to cope with any amount of high-class work speedily and at moderate rates.

The Yokohama Specie Bank, Yokohama, Japan, was commenced in 1899 and completed last year. Dr. Yorinaka Tsumaki, the architect, chose the Renaissance style for his design. The area covered is 23,217 square feet, and the height of the main portion is 55 feet. A considerable portion of the imported accessories came from the United States. An Otis hydraulic coin elevator connects the cash department with the basement vaults. Messrs. Clark, Bunnett & Co., New Cross Road, S.E., supplied their revolving shutters. The rolled glass was manufactured by Messrs. Pilkington Bros., Ltd., St. Helens, Lancashire.

ELECTRIC NOTES.

ON Tuesday last the borough of Southend, Essex, appointed Mr. Robert Birkett, late borough electrical engineer of Burnley, as the borough electrical engineer and general manager of the electric tramways.

SIR G. ARMYTAGE, chairman of the Lancashire and Yorkshire Railway Company, in speaking at a dinner given in Washington by the American Railway Association to 300 members of the International Railway Congress, predicted great development in electric traction.

THE Third International Electric Tramway and Railway Exhibition will be held at the Agricultural Hall, Islington, from July 3 to July 14. The purpose of the exhibition is to show the latest apparatus designed for the equipment of tramways of all systems. Over eighty town councils will appoint official deputations to visit the exhibition.

THE Carlisle Town Council have adopted the following resolution:—"That in future the price to be paid for the lighting by electricity of the Corporation offices and buildings other than Tullie House be fixed at the same rate as private consumers, viz. 5d. per Board of Trade unit, and that the resolution of the electric-lighting committee of December 29, 1899, fixing the charge at 2d. per unit, approved by the Council on January 9, 1900, be varied accordingly."

MR. J. A. JEKELL, the Coventry city electrical engineer, lectured on Saturday before the Birmingham and District Electric Club on "Cheap Electrical Energy for Power Purposes." The lecturer said there were a great number of stations throughout the kingdom where the plant was not as economical as should be, and it was these stations which hesitated to go in for a cheap supply of electricity. Many industries were dying out in the smaller towns which might be kept going if power could be obtained cheaply, without the necessity of using boilers, steam-engines and chimneys.

THE Lord Provost's committee of Edinburgh Town Council had a meeting on the 11th inst. with managers of three systems of electric tramway traction other than the overhead trolley. These systems, the "Dolter," the "Kingsland" and the "G.B.," were explained. It is understood that a complete working section of the "Kingsland"

system is to be set up. The "Dolter" and the "G.B." are what is known as electro-magnetic, while in the "Kingsland" the electric current is switched on or off automatically by the car itself by means of a simple mechanical switch. During the meeting Professor Kennedy, the electrical adviser of the Corporation, was present, and he will shortly present a report.

GOODWOOD HOUSE, Goodwood, the seat of the Duke of Richmond and Gordon, has just been fitted with electric lighting. The number of lights amounts to between 800 and 900. The wires have been introduced with no damage to existing decorations, yet there are no casings or tubes visible on the surface. In most of the rooms the existing fittings have been adapted for the electric light. The power is obtained from two 30 horse-power gas-engines, supplied by producer gas on the suction principle. With the special system adopted a unit of electricity can be produced for 2d., including fuel, labour, lubricating oil, repairs and loss in accumulator. A large storage accumulator has been provided capable of supplying 1,120 8 c.-p. lamps for five hours, and as the engines and dynamos are in duplicate a breakdown is practically impossible. The work has been carried out by Messrs. Drake & Gorham, Ltd., 66 Queen Victoria Street, S.W. The Duke of Richmond has also placed the lighting of Gordon Castle in the hands of the same firm. Here the motive-power will be water obtained from the river Spey, and the scheme also includes the lighting of the town of Fochabers with about 1,300 lights.

BUILDING AND BUILDERS.

IN our last number we referred to the works at Bloomsbury Chapel, which included new seating in circular form of pitch pine on the ground floor, and new seating in the galleries. It should have been mentioned that the whole of the reseating was carried out by the North of England School Furnishing Company, Ltd., under the instructions and in accordance with the drawings of Messrs. Barnes & Son.

THE plans and buildings committee of the Handsworth District Council have approved of the plans for a theatre in Soho Road. The project for the erection of this theatre

STAIRCASE, COUNTY SESSIONS HOUSE, PRESTON.

created violent opposition some months ago. The promoters, however, have now complied with the by-laws, and it is stated that the Council has no power to refuse to pass the plans.

THE Master Masons' Association of Glasgow and neighbourhood have issued a circular stating that it has come to the knowledge of the Association that the reconstruction of the Royal Infirmary is to be carried out in terra-cotta so far as the outer walls are concerned, and calling a special meeting of the Association to protest against this method of reconstruction being adopted for so important a building.

THE Grimsby Corporation building plans committee have passed plans for two new theatres. The first, the Tivoli Theatre of Varieties, is to be erected in Duncombe Street. The second comprises a large theatre, an hotel and an arcade of twenty shops, to be built fronting Hamilton and Park Streets, New Cleethorpes. The scheme will cost about 70,000*l*.

THE Sunderland Town Council rejected by thirty-two votes to fifteen a motion that as an experiment a works department be established for two years. It was contended that money could be saved by the Corporation carrying out its own work, and the work would be done more satisfactorily. The opponents of the scheme stated that out of sixty-four boroughs which had been approached only four had works departments.

A CONTRACTOR carrying out the erection of a new post office in Berwick-on-Tweed recently made application for a place to tip rubbish. It was suggested that part of the fosse connected with the old Edwardian wall be thus filled up. Several members objected to any interference with

the outworks of the ancient fortifications, one describing it as a piece of pure vandalism. It was agreed, on a vote, not to allow the fosse to be filled up.

AN inquiry has been held in Birmingham by Major Stewart, the Local Government Board inspector, into an application for sanction to borrow 41,000*l*. for works of paving, 1,550*l*. for the purchase of property in Park Street for the extension of the public lighting depôt, and 920*l*. for works of sewerage in Wellington Street. The paving works are in connection with the proposed construction of thirty-two miles of additional tramway lines.

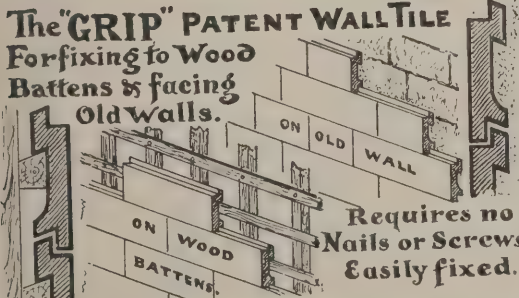

MR. J. WILLIAMS BENN, M.P., has given notice to ask the President of the Local Government Board whether he is aware that if the basis of the present assessment of the Houses of Parliament, namely, 40,000*l*., were amended to accord with the basis of the Carlton Club it would be 105,000*l*., and of the National Liberal Club, 122,000*l*.; and whether, in view of the rising rates of London, he will take steps to insure Government property bearing its proper share of rating.

THE Building Trades Federation of Birmingham some months ago proposed by 95 votes to 5 to take the necessary steps to dissolve it. A poll has resulted in votes being cast as follows:—For dissolution 2,582, against 311, spoiled papers 37. The total number of members who voted was, therefore, 2,930, and this is stated to be less than half the members. The rules provide that the Federation shall not be dissolved unless with the consent of two-thirds of the members, but the executive committee consider the figures satisfactory, and propose to proceed with the dissolution as speedily as possible. The income for three-quarters of 1904 is given as 145*l*. 7*s*. 10*d*. and the expenditure 91*l*. 16*s*. 8*d*., there being a balance of 53*l*. 11*s*. 2*d*., which, being added to 936*l*. 5*s*. 8*d*. brought forward, makes a total of 989*l*. 16*s*. 10*d*. This balance it is proposed to distribute.

THE executive committee of the Isthmian Canal Commission have decided to purchase in the markets of the world the material and ships which will be required for the construction of the Panama Canal.

VARIETIES.

THE Saffron Walden Town Council have decided to spend 20,000*l.* on a new sewage scheme.

THE Engineering Standards Committee have issued three further reports dealing with structural steel for shipbuilding, pipe threads for iron or steel pipes or tubes, and screw threads.

THE Federal Council of Switzerland state that in view of the progress made towards the completion of the Simplon Tunnel it will be possible to open the line at the beginning of October.

THE Surrey County Council have resolved to carry out a number of experiments for the prevention of dust caused by motor-car traffic, and a sum of 2,000*l.* was voted for the purpose.

MR. LIONEL BARNETT JOSEPH, the original inventor and patentee of the tramway rail running flush with the level of the streets, recently died in London at the age of seventy-eight.

THE Liverpool City Council have accepted a recommendation of the water committee that Mr. W. H. Lever should be paid the 138,449*l.* awarded him by arbitrators and upheld by the Court of Appeal, as the price of his Rivington estate. An amendment that a further appeal should be brought to the House of Lords was rejected.

THE erection in Lancashire of four large new mills has been decided upon during the last few weeks, making thirty-seven factories in all to be erected, which will hold 3,310,000 spindles. Three mills, not included in the above figures, have just been completed for working purposes. The cost of the thirty-seven mills will be in round numbers 4,000,000*l.*

THE Widnes and Runcorn transporter bridge will be formally opened on May 29. The bridge was thoroughly tested on May 9 and 12, Dr. E. Hopkinson, of Messrs. Mather & Platt, Ltd., superintending the tests. Messrs. Mather & Platt, Ltd., have supplied the whole of the electrical plant, having as sub-contractors Messrs. Crossley Brothers for gas-engines.

THE finance committee of the Manchester City Council in their report on the annual estimates of expenditure state the amount required by the improvement and buildings committee is 4,306*l.* in excess of last year's estimate. Of

this amount 3,511*l.* represents the additional charge in respect of the increasing debt for public street improvements, and a sum of 630*l.* is provided for the first time in respect of the services of the city surveyor's and city architect's assistants.

THE German Reichstag has passed the first and second reading of the Convention signed at the International Sanitary Conference in Paris on December 3, 1903, by the representatives of Germany, Austria-Hungary, Belgium, Brazil, Spain, the United States, France, Great Britain, Greece, Italy, Luxembourg, Montenegro, the Netherlands, Persia, Portugal, Roumania, Russia, Servia, Switzerland and Egypt.

A LOCAL GOVERNMENT BOARD inquiry was opened on the 11th inst. in Kingstown, Ireland, into an application for a loan of 29,100*l.* by the Urban District Council, the principal amounts being:—1,500*l.* to defray the expenses of the small-pox outbreak, 1,200*l.* for improving the baths at Sandycove, 1,000*l.* for erecting a public lavatory, 4,000*l.* for erecting a refuse destructor, 1,000*l.* for constructing sewers at Sallynoggin, 5,000*l.* to provide technical schools, 2,500*l.* for the erection of wash-houses, and 11,000*l.* for new Victoria Baths.

By kind permission of the Worshipful Company of Carpenters, an exhibition of the competitive plans and drawings for the new buildings of King's College Hospital at Denmark Hill will be held in the Court-room of the Carpenters' Hall, London Wall, E.C., from May 26 until June 1. The exhibition will be open on May 26 from 12 noon until 5 P.M., and on the five remaining days from 10 A.M. until 5 P.M., except on June 1, when it will close at 4 P.M. Admission on presentation of visiting card.

THE foundation-stones of the new Baptist church, Shooter's Hill Road, Blackheath, Kent, were laid on Thursday, May 4, by Mrs. Vinson, of Orpington, Mrs. Greenwood, of Shoreham, Mrs. Olney, of Champion Hill, and the Rev. W. L. Mackenzie. The number attending the ceremony was 500. Amongst those present were the Mayor of Greenwich, the Revs. Greenhough, Fotheringham and Joseph, Messrs. G. Lidgett, J.P., R. S. Jackson, L.C.C., F. Warmington, L.C.C.; the joint architects, Dottridge & Walford, and James F. Parker, the managing director of Patman & Fotheringham, Ltd., the builders.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of MESSRS. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

A new combination poorhouse for the parishes of Cambusnothan, Shotts and Bothwell was formally opened on the 12th inst. The site extends to ten acres, and the institution consists of ten different blocks of buildings, providing accommodation for 203 inmates, under the following classifications:—Receiving or probationary block, 10; four ordinary pavilions, two storeys in height, divided into day-rooms and dormitories for 70 males, 48 females and 24 children; hospital block, 24 males and 18 females; and a ward of five beds for maternity cases. In this block accommodation is also provided for nurses and the doctor. There is also a block of two cottages intended for married couples. The cost of the whole building will be about 175*l.* per bed, or altogether about 40,000*l.* The architect was Mr. Alexander Allan.

TRADE NOTES.

MESSRS. SAINSBURY BROS., LTD., Walthamstow, London, have just erected a new clock in the United Methodist Free church at Bude, Cornwall. It shows the time on two dials and strikes the hours and half-hours. It was executed generally to the designs of the late Lord Grimthorpe.

MR. HEINRICH, who for a number of years has been connected with the Custodis Company, has started business, trading under the name of Heinrich & Co., and is prepared to undertake the erection of tall chimney-shafts for factories, &c., on an improved system.

WHENEVER the history of the strengthening of concrete by the aid of steel is written the name of Coignet should be on the first page. The system has been widely utilised. It will henceforth be available in England, for Mr. G. C. Waterman, who has been a member of M. Edmond Coignet's staff for several years, has been appointed general agent for the United Kingdom. He has already been entrusted with the construction of floors and roofing on the Coignet system.

A HOUSE AT SIDCUP.

SEWER VENTILATION.

THERE is an objection everywhere to sewer ventilators, and if it were not for the strong arm of the law they would be likely to be destroyed by inhabitants of houses in their vicinity. Rawlinson's coarse maxim was, "The greater the stink, the more efficient is the ventilator," but it will take a long time for those who are not officials to accept that belief. Mr. W. E. Farrer, by his "Omnifex" system, will enable the evil, as well as the prejudice, to be overcome. His apparatus is not merely an outlet for foul air from sewers; it is at the same time a fresh-air inlet. By having two tubes of different sizes, one being within the other, the two kinds of air pass in different directions. The fresh air enters through a "bonnet" with aluminium flaps and gratings. It has sometimes happened that sanitary apparatus do not realise all the expectations of inventors, but from its simplicity and scientific principles the "Omnifex" system appears to be fitted to become a most efficient aid towards public health, for the outlet can be raised to any height which is desired.

NEW CATALOGUE.

It is not long since we noticed a catalogue of boilers and radiators manufactured by Messrs. Hartley & Sugden, Ltd., of the Atlas Works, Halifax. They have just issued another containing the latest information on the subject. Their foundry department has been enlarged, and they are now prepared to supply the whole of the necessary parts for heating apparatus, both boilers, radiators, pipes and

valves, &c. Their cast-iron sectional boilers are already widely used throughout Great Britain and on the Continent, and their wrought-iron boilers are also well known and approved. All wrought-welded and cast-iron boilers are most carefully tested by hydraulic pressure before leaving the works, and a "certificate of test and origin" given, if desired; they also guarantee the materials, workmanship and general satisfactory working of their boilers for a period of two years. The catalogue contains superior illustrations, and much information is given in tabular form.

VENTILATION AND SECURITY.

ONE of the difficulties at the present time is to utilise ordinary windows at night without diminishing the security of the building against burglars. The evidence given in courts at every assizes reveals that the window is commonly selected as the point of attack. Various means have been proposed. The latest is the "Lorie" patent ventilating window-fastener. By an ingenious arrangement the window can be opened to the extent of, say, 6 inches, but it cannot be moved from the outside. When the handle is turned downwards the fastener is ejected and holds a plate securely. Another advantage is that the rattling of windows is prevented. The fastener is manufactured by Messrs. W. & T. Avery, Ltd., of the Soho Foundry, Birmingham, and the name of the firm is a sufficient guarantee of the worth of the new fastener.

PHENIX-LIKE there has arisen on the Cleethorpes pier, owned by the Great Central Railway Company, a very handsome new concert and dancing pavilion, in place of the old one destroyed by fire. The new structure is to be opened on the Saturday before Whitsuntide, and to mark the special occasion a remarkably strong array of musical talent has been engaged by the company. Almost needless to say, excursions will be run from all parts at cheap fares, and it is anticipated that Cleethorpes will enjoy a record number of visitors.

BUILDING AND BUILDERS.

THE architects of the Bloomsbury Chapel, lately referred to in this column, are Messrs. George Baines and R. Palmer Baines.

THE Central Employers' Federation in Stockholm last week declared a lock-out against the bricklayers. Other branches of the building trade are also affected by this decision, which throws 15,000 men out of employment.

WESLEY COLLEGE, Sheffield, is to be altered in order to provide accommodation for 400 scholars; at an estimated cost of 18,000*l*. Messrs. Gibbs & Flockton are the architects. The building is now in charge of the education committee.

MR. WILLIAM WILSON FREEMAN, builder and contractor, Chester, died suddenly at his residence on the 20th inst. at the age of sixty-three. Among his more important jobs were the restoration of Chester Council chamber after the fire, the building of the isolation hospital and the public baths, and extensive contracts for the late Lord Harlech and others.

THE members of the Birmingham district of the National Association of Master Plumbers held their annual outing on the 20th inst., when, by permission of the Corporation of Birmingham water department, they visited the Elan valley and inspected the waterworks. On arrival at Rhayader the party were taken over the works to the various dams and reservoirs.

THE new Crown and Mitre hotel, Carlisle, which has been in course of erection for some years, will be opened on June 1. Accommodation has been provided for about sixty beds, at a cost of 50,000*l*. The hotel comprises basement, ground floor and first, second and third floors. At the wings there is a fourth floor. The basement is excavated and cellared, and six shops have been arranged for on the ground floor. Messrs. Oliver & Dodgshun, of Carlisle and Leeds, are the architects, and Messrs. Beaty Bros. builders.

A BILL has been passed by both houses of the New York State Legislature "to amend the Greater New York Charter in relation to the use of patented articles." One clause decrees that "No officer of the city government shall order any householder or freeholder to use any patented article on any building or in any public street or place, except

under such circumstances that there can be a fair and reasonable opportunity for competition, the conditions to secure which shall be prescribed by the Board of Estimate and Apportionment."

THE Liverpool Corporation have decided to give an assurance to the Local Government Board that the Corporation would rehouse, upon the sites cleared under the powers of the Liverpool Sanitary Amendment Act, or upon other sites to be approved by the Board, such proportion (not less than one-half) of the persons who might be displaced under future presentments by such clearances, unless the Board subsequently consented to waive or modify this requirement in view of the amount of suitable vacant land accommodation available for the persons to be displaced.

HOLY TRINITY CHURCH, London Road, Derby, which replaces a structure erected in 1831, was dedicated on the 18th inst. The new church is in the Early English style, and consists of a nave with aisles and transepts and an apse at the east end; the west end of the nave merges into the tower, which rises to a height of about 120 feet, and which is fitted with a clock with four dials. The exterior of the building is of red brick, with Coxbench stone dressings. The roof of the nave is lofty and is supported by stone pillars. The dressings to the arches and windows are, also of stone. There is seating accommodation for 800. The cost was about £11,500. The church is from the design of Mr. Charles E. Hewitt, of Westminster and Brighton. The contractors are Messrs. Walker & Slater, of Derby.

ELECTRIC NOTES.

ESTIMATES are sought by the Edinburgh electric-lighting committee amounting to 4,000*l*. for new water-tube boilers for M'Donald Road station. The total candle-power applied for during the year has amounted to 84,375.

THE Ashton Board of Guardians have adopted a scheme for lighting by electricity the new hospitals and the workhouse. The cost will be 3,162*l*., and Mr. Rhodes, of Manchester, will superintend the work.

THE largest electric generator in the world has been completed at Niagara Falls by the Canada Electric Com-

pany, of Peterborough, Ontario. It is to be used in the power works erected at the Falls and is of 12,000 horse-power.

THE London County Council last week decided to purchase the unexpired term of the lease of the North Metropolitan Tramway Company and its stock for 436,000*l.*, and to proceed with the electrification of the system. The ultimate cost of the acquisition of the London tramway lines and their electrification is estimated at 12 millions sterling.

THE directors of the Electric Railway and Tramway Carriage Works, Preston, have decided to purchase the Castle Car Works, Hadley, Salop, and the British Electric Car Works, Old Trafford, Manchester, for 85,000*l.* from the Amalgamated Waggon Company, Birmingham, who bought the undertakings when in liquidation for 65,000*l.*

MESSRS. M'DOWALL, STEVEN & CO., LTD., manufacturers of iron staircases, &c., of Glasgow, Falkirk, and 4 Upper Thames Street, London, have secured a large order from Messrs. Preece & Cardew, consulting engineers, London, on behalf of the River Plate Electricity Company, Ltd., for the electric-light arc-lamp pillars and carriers required for La Plata.

THE Penrith Urban Council received an offer from the National Electric Construction Company to take over, on favourable terms, the powers of the Council as to electricity supply obtained by provisional order. The Council decided that they would entertain the question of leasing their powers to a company, and that offers from substantial companies be invited by public advertisement.

NEGOTIATIONS between Greenock Corporation and the Greenock and Port Glasgow Tramway Company with respect to terms for a supply of electricity for the next five years from Whitsunday have been brought to a conclusion. According to the agreement, the company guarantees a minimum annual consumption of 500,000 units, and the payment is to be at the following rates:—First 500,000 units, at 1.5*d.* per unit; next 200,000 units, 1.25*d.* per unit; next 200,000 units, 1*d.* per unit; and all units per annum consumed in excess of 900,000 units, 0.85*d.* per unit. The maximum demand is not to exceed 660 k.w.

A SCHEME is being promoted in Germany for the connection of certain important towns by means of electric railway. It is proposed to establish between Düsseldorf and Cologne, a distance of twenty-four miles, between Halle and Leipzig, a distance of twenty miles, and between Wiesbaden and Frankfurt-on-Maine, a distance of twenty-six miles, a train service which in the towns and suburbs shall serve all the purposes of a tramway, but shall traverse the intervening distances at a speed of between fifty and sixty miles an hour.

THE Islington Borough Council were informed by the electrical engineer that the cost of a report on everything connected with the Council's electricity undertaking by an expert must depend upon the status of the expert called in and the magnitude of the work he was called upon to do. Professor Kennedy's fee for advising on the proposed expenditure of 15,000*l.* would be 75*l.*, and on that basis a report on the whole of the 400,000*l.* invested would cost about 2,000*l.*, and if extensive reports were required a good deal more.

THE electricity department of the Manchester Corporation were recently summoned before the city justices, on the information of the chief inspector of the sanitary department of the Corporation, for allowing dense black smoke to be emitted from the tall chimney at the Stuart Street electricity station. The offence was admitted, and an explanation was offered by the resident engineer that the smoke was caused by certain experiments. The usual order to abate in twenty-eight days was made. Several manufacturing firms were also fined for allowing black smoke to escape from their chimneys.

THE International Railway Congress have had an opportunity of examining a device for the prevention of train wrecks exhibited by the Pennsylvania Railway authorities in the Railway Appliance Exhibition, Washington. It is believed, says the special correspondent of the *Glasgow Herald*, that the invention will absolutely prevent train wrecking. The device works independently of the engine-driver. An electrical mechanism automatically sets the brakes in the case of a broken rail, an open drawbridge, a misplaced point or any similar defects. It also operates a valve that shuts off steam on the engine.

ARCHITECTURAL PHOTOGRAPHERS

To H.M. the King, H.M. Office of Works, H.M. Office of Woods and Forests, the London County Council, &c.

PHOTOGRAPHS TAKEN AND PROOFS DELIVERED SAME DAY. Price Lists and Estimates Free. 50,000 ARCHITECTURAL AND DECORATIVE VIEWS.

147 STRAND, LONDON, W.C. (FIRST FLOOR.)

THE Wednesbury Town Council have approved an agreement with the South Staffordshire Tramway Company for the purchase of the tramway undertaking in the borough, including the dépôt, offices and machinery at King's Hill, but excluding any portion of the line between James Bridge and Darlaston, for 28,920*l.* Of this, 11,500*l.* represents the price of the dépôt which was to be resold, and the balance would be repayable in thirty years, the tramway company reimbursing both principal and interest. A promise had been given that the reconstruction and electrical equipment of the Darlaston line should be undertaken forthwith, and when this had been carried out measures could be taken for the reopening of the Dudley section.

THE electrified section of the Lancashire and Yorkshire Railway between Liverpool and Southport is being metalled with a very hard marble-like stone of great non-conductive power. This stone, which will take 3,000 volts without penetration, is spread in a thin coating underneath and between sleepers, and renders the live rail perfectly harmless. Under these circumstances anyone touching the live rail receives no shock unless he forms a direct contact between the live and dead rail. This special non-conductive ballast, which is obtained from a quarry near Darlington, has already been adopted on the North-Eastern Railway's electric lines in the Newcastle district with satisfactory effect.

VARIETIES.

MESSRS. J. & W. STEWART, Great Brunswick Street, Dublin, and Belfast, have received the contract from the Department of Agriculture for the erection of temporary buildings for the Royal College of Science in Dublin.

THE Birkenhead Corporation have been making experiments with a new dust-laying composition, with what appear to be satisfactory results. The scene of the operations was about a mile in length of Laird Street.

THE Glasgow Corporation have appointed a deputation to proceed to Berlin and Brussels to examine and report as to the system in use in those places for giving the correct time on the public clocks. In Glasgow several unsuccessful attempts have been made to accomplish this object.

THE Mantada partition slabs of the Adamant Company, Ltd., have been subjected to tests by the British Fire Prevention Committee. The 2½-inch slab withstood the heat for 100 minutes before a vertical crack appeared. A 2¼-inch slab stood well through the fire test, but the partition was weakened by the carbonising of the wood slips which should have held it together.

A LOCAL GOVERNMENT BOARD inspector inquiry was held on the 23rd inst. at the Public Hall, Erdington, respecting an application of the District Council to borrow 8,000*l.* for the purchase of the Rookery estate at Birches Green for the purpose of a dépôt and recreation ground, and 11,000*l.* for the provision of Council offices and public library.

AT Canterbury new sewerage and sewage-disposal works have been opened at the irrigation farm. The works were commenced about seventeen months ago, and the plant consists chiefly of four pumps capable of pumping 100,000 gallons per hour, and two larger ones capable of dealing with 200,000 per hour. The cost of the whole scheme was about 28,000*l.*

THE Dunfermline Town Council recently resolved to proceed with a scheme involving an expenditure of between 8,000*l.* and 9,000*l.* for the erection of an additional storage tank and the construction of filters at the auxiliary ponds. The finance committee, however, have since recommended that it is inexpedient, in view of the state of the burgh finances, to proceed with the scheme.

THE Building Societies' Association in their thirty-sixth annual report presented on Wednesday, state that the Association now occupies a stronger and more assured position than in any previous period of its history. It now represents building societies whose total assets, according to the last report issued by the chief registrar, amount to upwards of 39,000,000*l.*

THE police and sanitary committee of the House of Commons have signified their consent to clauses of the Liverpool Corporation omnibus Bill relating to the borrowing of 200,000*l.* for street improvements. Clause 31 sanctions the repayment of the loan by means of a cumulative sinking fund in addition to the usual way of annual equal instalments.

THE MOMENTUM ENGINE (Patented). The Discovery of Mechanically-made Power.

NOW IN OPERATION AT THE ALEXANDRA PALACE, LONDON, N.

THE discovery; that, a free racing Flywheel possesses two natures, under one—it will receive rotary motion for the application of twenty pounds—notwithstanding it weighs a ton, and the second nature of the Flywheel is, that when it is connected to a working load it will throw out the rotary value of the centres of the weights in motion, by the square of the velocity, the centre of Gyration.

This discovery means several great Flywheels, each separately driven by any motive power, each Flywheel taking its regular turn to revolve a working shaft, to which it is connected, and from which it is disconnected for a greater length of time. Radium, and also these Engines, prove that the Theory of Energy is false. This Engine can be seen running the electric light at the Alexandra Palace. It is explained free.

The Engine has taken a first-class Diploma of Merit at the Alexandra Palace for Electric Lighting.

CONTRACTORS TO THE LONDON COUNTY COUNCIL.

A LARGE blast furnace on the American principle, erected by the Frodingham Iron and Steel Company, Ltd., was lighted on the 19th inst. The latest machinery in the market in the shape of blowing engines, &c., and automatic charging apparatus is attached, and the make of pig-iron at this furnace is expected to treble any one of those now in blast on the firm. All the ironstone is calcined before using.

A CONFERENCE of representatives of the City Corporation, the Westminster City Council and metropolitan borough councils held at Westminster on Friday last passed a resolution urging the Government to introduce a Bill into Parliament to give the highway authorities greater power to prevent the constant opening of public streets by the Postmaster-General and electric light, tramway and other companies.

A NEW hospital, erected at a cost of 10,000*l.*, on the pavilion system has been opened in Mexborough. The designs of Mr. J. E. Knight, Rotherham, were selected from the 27 sets submitted. The contractors were Messrs. W. Thornton & Son, Rotherham. The granolithic paving was supplied by Messrs. Hodkin & Jones, Ltd., Havelock Bridge Works, Sheffield. The laundry was equipped by Messrs. Summerscales, Ltd., Keighley, Yorks.

THE Bishop of Carlisle, in dedicating new bells at Bowness Church, near Carlisle, referred to the sweetness of bells in some country places, but said that he had lived in towns and would have been thankful if he could have buried nine-tenths of the bells whose clanging noise made them a nuisance. It was no testimonial to a church or chapel to have a cracked bell making a row all down the street. The whole question of bells in towns wanted reconsideration.

THE waterworks committee of the Lincoln City Council have conferred with Mr. G. H. Hill, of the firm of G. H. Hill & Sons, engineers, with regard to a new supply of water for the city. He recommended a scheme for obtaining it from Dorrington at a probable capital cost of 90,000*l.* exclusive of legal and engineering expenses. The working expenses for softening and pumping, exclusive of interest on capital, will probably be between 8,000*l.* and 9,000*l.* a year. The committee came to no definite decision in the matter.

THE Surrey education committee some months ago issued picture postcards to the schools under their control as an encouragement to the pupils to attend regularly. The scheme has not proved an unqualified success, and the opinion of the divisional school attendance committees is being asked as to the advisability of continuing it. The cost is about 750*l.* per annum. A sum of 500*l.* appeared in the estimates for the supply of a million postcards.

A SECOND edition of the "Furniture Styles," by Herbert E. Binstead, editor of the *Furniture Record*, will be issued immediately. The work has been well received, and the first edition published in November last is entirely exhausted. No book covering the same ground has hitherto been issued at such a low price (five shillings). It is fully illustrated throughout and covers a period from the Elizabethan to L'Art Nouveau styles, the latter style being fully treated. The publisher is Mr. A. H. Botwright, 14 City Road, E.C.

MESSRS. WESTGARTH, RICHARDSON & Co., Ltd., have completed the first of a pair of the largest rolling mill engines in the world. The engines are intended to drive a new 40-inch cogging mill. They consist of a set of three crank vertical compound engines of 15,000 horse-power, having cylinders of 45-inch diameter and 52-inch stroke. The engines are designed to work up to 200 revolutions per minute, the steam pressure being 200 lbs. per square inch. The weight of the engines is 500 tons each. The labour saving contrivances will enable them to be operated by one man.

THE Association of Master Plumbers, at their annual meeting in Buxton on Monday, confirmed the minutes of the half-yearly and central board meetings, the latter containing a resolution expressing great regret and disapproval at the resolution of the sub-committee of the water regulations joint committee suggesting that local associations should insist on registration as a qualification of authorisation. The Association also considered that the effects would be most unjust to many engaged in plumbing, because registration in its present condition could not be taken as an absolute test of qualification. The resolution was ordered to be sent to the committee on water regulations and the various local authorities and the Local Government Board.

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for Framing.

- THE ENTHRONEMENT OF CHARLEMAGNE.** From the Wall Painting in the Panthéon, Paris, by M. HENRI LEVY. Size Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

THE EXALTATION OF ART. (Ceiling Painting in the Hôtel de Ville, Paris.) By Mons. LÉON J. F. BONNAT. (Printed in Colours.) Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

MASTER BUNBURY. From the Painting by Sir JOSHUA REYNOLDS. Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

ST. PAUL PREACHING AT EPHEBUS. By EUSTACHE LE SUEUR. From the Painting in the Louvre. Printed in red or black. Size, Thirty Inches in depth by Twenty Inches in width. Price, Two and Sixpence each; free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

Publishers, GILBERT WOOD & CO. Ltd., 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

SUPPLEMENT

"The county surveyor to the Cumberland County Council in his report to the highways committee states that the increasing use of traction engines and motor cars must necessarily increase the cost of maintaining the main trunk roads. He finds as a rule that the inflated tyres of the quickly driven motor car do quite as much damage to the surface of the strong roads as the heavier traction engine, as they pull up the binding and so loosen the surface of the roads. If the speed were limited to fifteen miles an hour this damage would be almost imperceptible.

The floating steel dry dock now approaching completion at Baltimore for the Philippines will be the largest structure of its kind in the world. It is 500 feet long over all, 134 feet wide, 42 feet high on the walls clear of the pontoons, and has a lifting capacity of 20,000 tons. It contains 11,000 tons of steel, the side walls are 64 feet high from the bottom and the pontoons are 18 feet deep. When floating at light draught the dock will draw $6\frac{1}{2}$ feet of water, and when submerged it will require 63 feet of water to give a draught of 30 feet above the blocks. The cost will be 24,800.

THE official inspection by the Board of Trade inspector has been made of the Bangour Railway, which has been constructed by the Edinburgh District Lunacy Board from Uphall station to Bangour as a means of communication with the village pauper lunatic asylum at that place now being constructed. The railway—2½ miles in length—has cost over 30,000*l*. It has been in operation for some time in conveying material for the buildings in course of erection at Bangour, and it is estimated that it has saved about 18,500*l*. on contract prices in consequence of the facilities it has afforded for the conveyance of stone and lime and iron to the works.

AN official memorandum showing progress and expenditure, &c., on items in the Naval Works Act, states that though the date fixed in the Act for the completion of Dover Harbour is 1907-8, it is probable that the work will not be completed until the following year, viz. 1908-9. The Admiralty Pier extension, the east arm and the east reclamation are all completed, except the above-water work at the extremities of the breakwaters. The south breakwater has been commenced, and a short portion at the east end is up to water-level. The expenditure incurred

up to March 31, 1905, was about 2,287,000%, the total estimate under the Act being 3,500,000%.

A COMMISSION recently appointed by the Italian Government to study a plan of river navigation along the Po and its confluent between Venice and Milan have arrived at the following conclusions, viz. :—(1) To establish a direct service for 397 kiloms, with 600-ton flat boats from Venice to Milan, through Brondola, Cavanella, Adda, Pizzighettone and Lodi. (2) To group and connect all the branch lines to the principal one and to the lakes in a uniform manner, so as to cover a distance of 3,410 kiloms. The expenditure to be incurred in excavating and improving the services has been computed to be about 4,720,000*l*.

FALKIRK Town Council on Monday considered the application of the contractors laying the tramways in Falkirk for consent to the opening up of thoroughfares within the burgh at stretches greater than 100 yards, the maximum allowed by the Act, provided the local authority withhold consent. The application arose out of an interim interdict taken out against the contractors for opening a road at stretches of 400 yards and leaving crossings shorter than a quarter of a mile. The interdict was withdrawn on condition that the defenders abided by any stipulation the Town Council might make, and the Council have now determined not to grant their consent.

In pursuance of a resolution of the House of Commons, the Local Government Board have recently sent to the clerk of each metropolitan borough council and to the clerks of every county council, borough council, urban and rural district council and board of guardians in England and Wales a circular letter asking for replies to the following questions:—(1) Date of the last contract for the execution of works entered into by the local authority, *i.e.* each local authority mentioned above; (2) do the contracts for the execution of works entered into by the local authority specify any conditions as to the wages to be paid by the contractor, or other conditions with regard to the persons employed by him? (3) if so, what are the conditions so specified? When the local authorities have sent in their replies the information will be tabulated in a return to be laid before the House of Commons.

20 OLD CAVENDISH STREET, W., LONDON

CASES FOR BINDING THE ARCHITECT.

Price Two Shillings. Office—6-11 Imperial Buildings, Ludgate Circus, London, E.C.

THE sea-water baths erected by the Corporation of Carnarvon at a cost of 2,675*l.* have been opened on the Aber shore. The bath measures internally 250 feet by 95 feet 6 inches, and will contain at high tides about 690,000 gallons of water, ranging in depth from 3 to 10 feet. A caretaker's office and 20 bathing boxes are provided on a terrace at the inner part of the bath, and space provided for future extension and the erection of hot and cold private baths. Room for spectators is provided above the bathing boxes. The bath and buildings have been constructed by Messrs. George Roberts & Bro., Llandudno, from the designs and under the supervision of Mr. Edward Hall, M.S.E., borough engineer.

A LOCAL GOVERNMENT inquiry has been held into the application of the Eccles Town Council to borrow 12,500*l.* for the purpose of erecting workmen's dwellings in Lewis Street and Mellor Street, Patricroft. The Council propose to acquire 12,000 square yards of land at a cost of 2*d.* per yard. Upon 6,820 square yards it is intended to erect forty-six semi-detached houses, and upon the remainder of the land to erect a public elementary school to accommodate about 1,000 children. The houses are to be semi-detached, with three bedrooms, and a garden at the back of each. The rents will average about 7*s.* per week. On the Timothy Street site (the insanitary area) the Council propose to erect nineteen houses on the west side of Corporation Road, which is now being laid out for building purposes; but as to the remainder of the area the Council has not yet decided upon a scheme. By the present proposals accommodation would be provided for 390 persons.

In a report on the trade of Mexico for the year 1903, Mr. Bjorklund, clerk to H.M. Legation at Mexico City, states:—"There are quite a number of articles which are made in the United Kingdom which for some reason or another have decreased in importance, or which, through an oversight on the part of the manufacturers and exporters, other nations have been allowed to enter the field where once they had control. With the development of the country, the opening up of new districts, both agricultural and mining, the building of the port works and other public works, the construction of railways, the sanitation of many of the large towns of the Republic, the starting of new

industries, &c., an ample field is open for all kinds of articles which in former years were never even thought of for this market. Electricity, too—a power which under the present conditions seems destined to take the place of steam and water—supplies motive-power in districts which last century were still considered to be too far from any centre to be of any importance either for commercial or industrial purposes."

BUILDING IN EDINBURGH.

A REPORT has been prepared by Mr. James Massie, burgh engineer and master of works for the city of Edinburgh, on the work done by his department during the year ended December 31, 1904.

Notwithstanding the outcry about dulness of trade and want of employment among the working classes, the upward tendency in value of work presented for warrant to the Dean of Guild Court seems to show that much was contemplated during the past year if little has been realised. Both in the number of warrants granted and in the value of the work which these warrants represent are there considerable increases over the corresponding figures of the previous year, the totals being 862 warrants granted for 1904, against 802 for 1903, and the values of the work 994,940*l.* and 825,584*l.* for these years respectively. Turning to the work certified as completed during the year, the value is given as 668,820*l.*, as against 824,972*l.* for the year preceding. This does not necessarily imply a reduction of 156,152*l.* in the value of the work executed, as works started or in progress are not included, but in this respect the figures for the two years are on the same footing. The great reductions in value come under the heading of "Public Buildings and Alterations," which only total 99,920*l.* for 1904, against 175,322*l.* for 1903. Judging from the figures relating to villas, self-contained houses and tenements, it would appear that speculative building has suffered no check during the past year, as the estimated value of these classes of buildings certified amounts to 568,900*l.*, against 449,650*l.* for the year before. Whether the demand will equal the supply in this direction remains to be seen, but it appears that the allurements of fresh paint and new surroundings prove irresistible to a certain class, and new tenement property

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS
COMBINING LENSES AND PRISMS.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

MAXIMUM LIGHT GLASS

Is supplied in sheets for glazing like ordinary window glass.

Also in ornamental patterns glazed in lead.
And in crystal tiles framed in copper.

VOLUME LXXII. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12*s.* 6*d.*
Imperial Buildings, Ludgate Circus, E.C.

of a good kind finds ready tenants. Whether it is to satisfy a demand, or is only a chance circumstance, the number of warrants applied for during the year, and the value these represent, show a large increase in the case of self-contained houses. Villas also show an increase, but in a less degree.

The report states that the only works carried out in connection with the housing of the working classes during the year had been the reconstruction of old tenements in Greenside. Of the 13,700*l.* sanctioned for the building scheme in this district, 6,500*l.* was allowed in the year's estimates for the rebuilding and remodelling of two tenements in Greenside Row, three tenements in Queen's Place and one in Gilchrist's Entry, embracing in all forty-eight houses of kitchen and bedroom and thirty-five houses of single apartment. The estimated cost of rebuilding these five tenements was 6,950*l.*, and the estimates accepted for the works amount to 6,907*l.* 10*s.* 5*d.* The rebuilding of the two tenements in Greenside Row was commenced in February, and the houses were ready for occupation in December. The second contract for reconstruction of two tenements in Queen's Place was commenced in April, and the houses are about ready for occupation; and a third contract for reconstruction of tenements in Queen's Place and Gilchrist's Entry was commenced in December. The work still to be undertaken under the scheme, as sanctioned by the Council, embraces the reconstruction of three tenements in Simpson's Court, two tenements in Greenside Row and Marshall's Court, the paving of the streets and courts and the demolition of certain old properties incapable of renovation. The sum allowed for this work is 6,550*l.*; but since the adoption by the Council of the proposals contained in report of September 14, 1903, two other properties have been acquired, which will require to be dealt with in a manner similar to those now in hand, and for which no allowance has yet been made. Of the properties acquired in Cowgate and Robertson's Close by private treaty, and comprising four tenements in Robertson's Close, one tenement in Cowgate, tenement, stables, &c., in South Niddry Street, three tenements and all the stables have been demolished, and the sites are presently open ground. Of the three tenements remaining, the two in Robertson's Close have been recon-

structed. The work was sanctioned by the Council in May, at a probable cost of 1,030*l.*, and was commenced in June and completed at the end of December for the sum of 997*l.* To complete the improvement of this area, the remaining tenement in Cowgate would require to be taken down and set back to the line of the buildings adjacent, as the carriage-way of Cowgate at this point is only about 17 feet wide, and this tenement and the one almost opposite form now the only obstructions to this thoroughfare, the street having been widened and improved at the east and west ends by the Improvement Scheme and Act of 1893. The clearing away of the old properties in Paul Street was carried out during the year. Gilmour Street has been widened to 40 feet.

The period of exemption under the Act of 1899 having now elapsed, all advertisement sites, with the exception of those specially provided for by the Act, can only exist and be continued under the license of the Corporation. Of the sites referred to, 177 have been licensed for a period of two years from October 25, while licenses for thirty-two sites have been declined.

Vans and lorries drawn by horses, and hand-carts or barrows, besides the usual sandwichmen, are now largely used. This undesirable mode of advertising, it is alleged, is the result of want of space on hoardings and gables, and it might be well, he thinks, to keep that fact in view when applications are being considered. The demand for sky-signs still continues, and it is satisfactory to note the continued improvement in design and workmanship of these productions, the evident desire of all interested being to exhibit some sign both original and artistic.

IGREEK MARBLES.

THE British Consul at Piræus reports that among the most important items exported from the district is the marble from the quarries of Pentelicus, owned for the most part by the British company, "Marmor." Most of this is shipped to Hamburg, but it is satisfactory to note from the shipments last year indications that fresh markets are being developed. This industry has naturally a formidable rival in Carrara, and only by perseverance and great attention to economy in

the cost of production and transport will it be able to compete on satisfactory terms. The company is at a distinct disadvantage at present in the matter of transport, owing to the absence in the port of Piræus of properly appointed loading jetties in connection with the railway, alongside of which vessels of reasonable draught could lie. It is consequently necessary to load from lighters, the marble thus undergoing an extra handling, which has to be paid for. During last year there was an output from the company's quarries of Stamatovouni, Vlachos, Melana, &c., of 2,262,019 cubic metres; from Skyros the amount was 758,888 cubic metres; from quarries at Styra and Tinos 261,029 cubic metres, making a total for 1904 of 3,281,936 cubic metres.

CANAL DEVELOPMENT.

A MEETING of the Liverpool Chamber of Commerce was held on Monday, when Mr. G. H. Cox referred to the position of the new Canal Bill, which had been agreed to by the Chambers and the Mansion House Association. The Bill would, he said, be proposed on Friday by Mr. Barran, one of the members for Leeds. It provided for the taking over, improving and managing of certain canals which formed a chain of intercommunication between the principal ports in England. Powers were also taken for acquiring subsequently other canals—with the exception of the Manchester Ship Canal, which was a port from one end to the other—and for their improvement and management. Such consolidation of interest and management would improve the facilities for water carriage and establish a complete system of intercommunication. They were all agreed that we were very much behind continental nations and our cousins in the United States and in Canada as to better means of communication by water, with the consequence that our internal transit was very much more expensive than it was in any other country. We were waking up to that fact, but unless some means were adopted in this country for cheapening the cost of transit, we should lose a considerable portion of our international trade, which was being captured by our continental neighbours and by the United States and Canada. He did not think the public had any

idea of the vast sums of money that had been spent during the last ten years on the Continent and on the other side of the Atlantic in perfecting great canal and waterway schemes. The Bill had one fatal flaw, in that it only provided that eight members of the trust were to be elected by the tollpayers. This was far too small a proportion, and he feared would never serve the interests of the traders.

Mr. W. F. Lawrence, M.P., associated himself with what Mr. Cox had said about intercommunication by water. When we read that in France there was practically communication from the Bay of Biscay to the Mediterranean and considered the various waterways in the heart of Germany, and that in retrograde and slow-moving Russia they were actually talking of having a connection—not, he feared in the very near future—between St. Petersburg and the Black Sea, it was time for us to repair the perhaps mistaken policy of sixty or seventy years ago, when the railways were initiated and canals, of which we now saw the extreme importance, were unduly depreciated.

Mr. Austin Taylor, M.P., hoped it might be truly said that we were now at a point of expanding trade.

NICKEL AND IRON.

At the meeting of the Iron and Steel Institute a paper was read by Mr. Robert A. Hadfield describing "Experiments relating to the effect on mechanical and other properties of iron and its alloys produced by liquid air temperatures." He said that the importance of the discovery of the toughening effect of nickel upon iron at low temperatures will be seen when it is understood that whilst it has been well known that nickel in certain percentages produced important improvements in the qualities and properties of iron and steel alloys, no microscopical or chemical research work has yet proved why this came about. To Mr. Hadfield it seemed clear that these experiments go a long way towards offering a satisfactory explanation. It will be seen that the purest iron, as represented by the "S.C.I." containing 99.82 per cent. iron and of specially high quality and purity, becomes brittle to an extraordinary degree under the influence of the low temperature—182 degs. C. (test Nos. 95A and 136), whereas nickel itself tested at the same low temperature

GILBERT WOOD & CO. Ltd., Imperial Buildings, Ludgate Circus, E.C.

(test No. 120) has improved rather than deteriorated, not only in tenacity, which iron also does, but in ductility, in which latter quality iron entirely breaks down. If nickel therefore is present in an iron alloy containing but little carbon or comparatively low in that element, it acts as a preventive of brittleness, or is a very considerable modifier of that objectionable quality.

At ordinary temperatures the toughness or ductility of nickel is no greater than that of iron. For example, in comparative tensile tests, made by him, of nickel and pure iron, the ductility of iron was greater. The reduction of area in the material generally shows its condition as regards ductility; in the specimens in question the reduction of area in the tensile test bars was nearly 20 per cent. greater for iron in both his "S.C.I." and Arnold's pure iron than in the nickel specimen tested. Iron to a more or less degree, at any rate in manufacturing operations, always seems to be endeavouring to wander out of the "paths" of ductility and toughness; it is constantly endeavouring to become brittle. It will often assume its apparently brittle nature on the slightest provocation, and the metallurgist by his arts is always trying to correct this tendency. As with humanity, there seems to be a law of tendencies, and iron by heredity is constitutionally weak. It would appear therefore that iron, a cheap and convenient metal itself, must be permeated by some element that will mask or modify its properties. Until comparatively recently carbon was the only element known to modify the properties of iron; but this element, where great toughness is required, only helps to make matters worse. Fortunately for iron, however, its close companion, nickel, singularly enough in the same group, comes along and acts as a friend in keeping it—iron—up to the mark, and preventing it from wandering out of the narrow road of metallurgical rectitude; that is, of toughness or ductility. Exactly why this should be so cannot easily be explained, but this is the fact. Possibly some interpenetration of the atomic mass causes a change which cannot as yet be deduced by any known chemical investigations. Iron, too, is a very crystalline metal, whereas nickel appears to be much more amorphous; it is possible, therefore, that nickel tends to prevent iron crystallising in this manner, or prevents it cooling in such large or dangerous type of crystals. This action of nickel is simply marvellous in

certain of the alloy specimens; for example, with an alloy of iron, carbon 1.18 per cent., nickel 24.30 per cent., and manganese 6.05 per cent. Here the ductility is extraordinary at not only ordinary but low temperatures, probably the highest known for any iron alloy, and certainly for an alloy having such tenacity as 84 tons per square inch. There is still present in this alloy 68 per cent. of iron, yet the tendency of the latter metal to wander into the paths of brittleness is not only entirely checked at the liquid air temperature—and this brittleness, as shown so clearly in this research, occurs to an extraordinary extent in pure iron cooled to -182 degs. C.—but the elongation or ductility already so great is considerably increased, namely, from 60 per cent. to $67\frac{1}{2}$ per cent. There is also an increase of tenacity in both cases, namely, a rise of from 10 to 38 per cent. Thus the nickel present—as these results cannot apparently be ascribed to any other cause—enables the bar under this high tension and at 182 degs. C. to remain far more ductile than the very best of ductile iron of one-third the tenacity.

Although the action of nickel has been specially referred to, it must not be overlooked that in this alloy there is also present 6 per cent. of manganese, which in its ordinary combination with iron—that is, with no nickel present—would confer intense brittleness upon the iron, and render it more brittle than if not present. This treble combination of nickel-manganese with iron appears to reverse all the known laws of iron alloys. M. Osmond's theory as regards these iron nickel-manganese alloys is that manganese acts here in the nature of nickel. He considers that 1 per cent. of manganese is equivalent in its action upon iron to 2 per cent. of nickel. In conclusion, it may be said that the many extraordinary changes brought about in the physical properties of iron and its alloys could not have been deduced from any known laws. Iron in the main is "embrittled" to an extraordinary degree by liquid air temperature, and yet it will be seen that this "hereditary" tendency can be entirely checked in certain of its nickel iron-manganese combinations. These various changes appear to be certainly not chemical, and it is rather to the physicist we must eventually look for a full and correct explanation of the many curious results obtained in this research.

Architect and Contract Reporter.

IMPORTANT NOTICE

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of MESSRS. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

HOVE.—Aug. 1.—Designs for new free library, not to exceed 10,000*l.* (exclusive of furniture). Premiums of 50*l.*, 30*l.* and 20*l.* Further particulars, Mr. H. Endacott, town clerk, Town Hall, Hove.

PERTH.—Aug. 1.—Plans for (1) reconstruction of the existing city hall at a cost not exceeding 6,000*l.*, and (2) erection of a new hall at a cost not exceeding 15,000*l.* Premiums will be awarded authors of plans placed first, second and third in order of merit as follows:—(1) For reconstruction, 30, 20 and 10 guineas respectively; (2) for a new hall, 50, 30 and 20 guineas respectively. Instructions, general conditions and plan of site from Mr. John Begg, town clerk.

CONTRACTS OPEN.

ALNWICK.—June 8.—For various works at the Alnwick workhouse. Mr. H. W. Walton, clerk, Alnwick.

MAY-OATWAY FIRE ALARM.

WHAT USERS SAY.

Messrs. J. Thomasson & Sons, Spinners, of Bolton write:—"A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily, 10 minutes before the Automatic Sprinkler went off." Loss £48. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works, Edinburgh, write:—"A fire broke out in our factory during the dinner hour on January 18, 1905, when the May-Oatway installation (put in since our previous fire) saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well." Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.O., Premier, writes:—"This system has been largely adopted in New Zealand, and has given the greatest satisfaction." (The Government are the largest users; protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—"Fire March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss." Claims paid, £10 and £50 respectively. What have you done to limit your loss?

Send for circular, or call and inspect 94 Paul Street, E.C. : Glasgow, Liverpool and Manchester.

WILLESDEN PAPER

FOR ALL CLIMATES.

Architects are desired to specify **Willesden 2-Ply**. The Best Underlining on the Market. Used by Leading Architects. See next issue.
WILLESDEN PAPER AND CANVAS WORKS, Ltd., WILLESDEN JUNCTION, LONDON, N.W.

WAPLER'S VENETIAN BLINDS

Are fitted with a very simple and effective Check Action. (OWN PATENT.)

Are very light and elegant in consequence of the laths being extra thin. Are as easily worked and taken down as ordinary roller blinds. There is nothing to get out of order. The wear on tapes and cords reduced to a minimum.

For all our Venetian Blinds we use only the very best selected Pine.

WAPLER & CO., 699 Fulham Road, London, S.W.

TRADE NOTES.

MESSRS. A. W. PENROSE & Co. have obtained the entire contract from Messrs. A. W. Gamage & Co., Ltd., for the five electric lifts required in the new and old buildings. Many of the company's lifts are serving for passengers and goods in the Metropolis as in other places.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent exhaust roof ventilators and inlet ventilators to St. Luke's Church, Crosby, Liverpool.

MESSRS. HICKIE, BORMAN & WOODS, LTD., of 4 Lloyd's Avenue, London, E.C., have been appointed sole agents in the United Kingdom for the "Anduro" roofing and damp-course. It is claimed for "Anduro" that it is waterproof, airtight and light in weight, and that as no tar is used in its manufacture it is absolutely odourless.

THE Simplex Steel Conduit Company, Ltd., have, in consequence of the increase of their business, been compelled to build new works, which are situated at Garrison Lane and Maxstoke Street, Birmingham. The new works are equipped with the most up-to-date and labour-saving appliances. The firm will thus be enabled to guarantee quick delivery of all orders entrusted to them.

MESSRS. SISSONS BROTHERS & Co., LTD., have issued a handy guide on the applications of the universally known Hall's distemper. Sketches are given in colour which will suggest pleasing combinations of several of the seventy-three colours in which the material is prepared, and are adapted for walls and ceilings. "Sisco" enamel can be advantageously used for the woodwork. Copies can be obtained on application to the Hull or London office.

THE finance committee of the Holborn Borough Council reported at the last fortnightly meeting that they had had several applications for the return of money deposited with tenders. Upon consideration of the circumstances it appeared to them that they ought to return the amounts. Accordingly they had ordered that the sums should be returned. The total amount was 170*l.*, some of which was received as far back as the year 1900. The proposition was adopted.

BUILDING AND BUILDERS.

THE Lancashire education committee have decided to build an elementary school to accommodate 300 children at Cleveleys, near Blackpool.

PLANS for the extension of the St. John's Road work-house by the addition of two blocks of four floors each have been submitted by the Islington Board of Guardians to the Local Government Board for approval. The estimated cost is 12,000*l.*

THE erection of the South Bank, Yorkshire, Baptist church is about to be commenced. The contract amount is 3,234*l.* for the church, church parlour, vestries, &c., the seating accommodation being about 630 persons. Future schools are arranged for at the back of site. The architects are Messrs. George Baines & R. Palmer Baines.

THE Chief Secretary for Ireland has stated in a printed answer that Mr. J. F. Fuller, Great Brunswick Street, Dublin, the architect of the Commissioners of National Education, in connection with the erection of buildings at Glasnevin, will be instructed to allow any contractor who so desires to submit an alternative tender for the supply of Irish slates.

THE wages dispute between the operative masons and builders of Dunfermline and their employers has been settled. The men accepted the masters' terms of a reduction of one penny per hour, with an allowance of one halfpenny to hewers for whom no shed accommodation is provided. Under the agreement for this year the wages will accordingly be 8*d.* and 8½*d.* per hour.

THE foundation-stone laying ceremony of the Sutton-in-Ashfield Congregational church took place on May 24. The church occupies a prominent corner site, a bold tower being a bold feature at the corner. The contract is let to Mr. John Greenwood, of Mansfield, the amount being 3,982*l.* 15*s.* 4*d.* The church will accommodate 850 persons. The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, W.C.

THE London and North-Western Railway Company recently made application to the Local Government Board for their approval of a scheme for providing housing accommodation for 840 persons of the working classes near Gloucester Gate, Regent's Park. The Board was to hold

an inquiry with regard to it on the 30th ult. at the town hall, St. Pancras, but the railway company withdrew the scheme at the last moment.

ALL SAINTS, Burton-on-Trent, which has been erected at a cost of 30,000*l.*, was consecrated on Saturday. The church has occupied three and a half years in the building. The plan includes a nave, with north and south aisles, and a narthex at the west end, with a porch on the south side and an entrance under the tower on the north. The roofs are mainly of oak, and the materials used for the exterior are Coxbench and Weldon stone, while the internal dressings are of red Hollington. The fittings are all of oak fumed to a dark colour, and the seating accommodation is for 800 persons. The architects of the new church were Messrs. Naylor & Sale, of Derby, and the contractors were Messrs. Thomas Lowe & Sons, of Burton.

ELECTRIC NOTES.

THE electricity committee of the Bradford Town Council have approved the report of Mr. A. S. Blackman, the electrical engineer, which recommends the extension of the mains at a cost of 37,500*l.* It is suggested that a loan of 60,000*l.* be obtained to provide for future requirements.

THE North British Railway Company recently applied electricity to the lighting of the signals on a portion of its system. Owing to the success of the experiment there will very shortly be an extension of the use of it, commencing with the Waverley Station, Edinburgh, where two lights have been installed for some time.

THE New York Central Railroad Company recently made comparative tests between steam and electric locomotives of the latest pattern on a track six miles in length, which resulted in demonstrating beyond dispute the superiority of the electric locomotive. In every test the two trains started from rest, and careful records were made of the speed, distance, time and power consumption.

A SCHEME is proposed for carrying out a South Manchester electric railway for goods and passenger traffic, which would connect the various main lines from London

to Manchester. The proposed new railway will be an express suburban cross country "belt line" of standard gauge and constructed as a light railway, the main line being about 16½ miles long, and the branches bringing the total mileage up to about 26 miles.

Mr. V. M'COWEN, the Belfast city electrical engineer, recommends that from July 1 next certain reductions and alternative prices for electricity be adopted. The proposals, if carried out, will mean a reduction of the year's profits by about 1,500*l.* The revenue from the electric-light department for the year ended March 31 last was as follows:—Gross revenue, 28,141*l.* 3*s.* 5*d.*; gross expenditure, 11,156*l.* 13*s.* 6*d.*; revenue, 16,984*l.* 9*s.* 11*d.*; less interest and sinking fund, 12,627*l.* 2*s.* 7*d.*; leaving the net revenue 4,357*l.* 7*s.* 4*d.*

An inquiry was held at the Guildhall, Gloucester, on Tuesday, by Mr. H. Ross Hooper, Local Government Board inspector, into an application made by the Town Council for power to borrow a further 12,100*l.* for the extension of their electricity undertaking. The extensions at the electricity works include the installation of three new boilers and other plant. The inspector commented on the lowness of the cost—1½*d.* a unit—out of total works charges, and said it did not seem to him that the Corporation were charging what the public lighting was costing them, which should be based on candle-power of the lamps. The engineer said they had not based the cost on the candle-power of the lamps as suggested.

THE electric-supply committee of the Birmingham City Council in their annual report state that 4,645,027 units were sold during the year at a money value of 71,195*l.*, compared with 4,367,164 and 69,421*l.* respectively in the previous year. The revenue account showed a credit balance of 39,573*l.*, compared with 36,939*l.* in the preceding year. The total cost of production worked out at 1.584*d.* per unit, against 1.742*d.* previously. The net result of the year's working, after paying interest and sinking fund charges, amounted to 28,784*l.*, with a surplus of 10,789*l.* This amount has been carried to the statutory reserve fund.

THE following tenders were accepted for the erection of an electrical station in Summer Lane, Birmingham, for the Corporation:—Sapcote & Sons, foundations 15,777*l.*, build-

THE Institute of Electrical Engineers, at their general meeting on Friday, held at Westminster, elected Mr. John Gavey, C.B., Engineer-in-Chief to the Post Office, president for the ensuing year. Dr. R. T. Glazebrook, F.R.S., Director of the National Physical Laboratory, Mr. J. E. Kingsbury, of the Western Electric Company, Mr. W. M. Mordey and Mr. W. H. Patchell were chosen for the office of vice-presidents. It was announced that three Salomons scholarships for 1905 of the value of 50*l.* each had been awarded respectively to A. E. Clayton, of King's College; E. A. F. Goodfellow, of the Central Technical College, South Kensington; and F. C. Prentice, of University College. Two David Hughes scholarships of the value of 50*l.* each were also awarded to E. A. Biedermann and J. B. Sparks, of Finsbury Technical College.

VARIETIES.

APPLICATION is to be made to the Local Government Board for permission to borrow 15,000*l.* for the erection of new municipal offices for Smethwick.

THE Coventry and Warwickshire Hospital is to be extended at a cost of about 35,000*l.*, according to plans by Messrs. Tiltman & Chataway.

THE church of St. Nathaniel, Liverpool, was opened yesterday. It is basilican in plan, and was designed by Messrs. George Bradbury & Sons.

WE have been requested to announce that the forty-fifth annual dinner of King's College, London, will be held at the

Hôtel Cecil on Monday, June 26. Colonel Richard H. Jelf, C.M.G., will be in the chair.

ACCORDING to Mr. John Burns, M.P., London stands alone in not having had one fire or lost one life in a theatre or music-hall in seventeen years, there being 360 such houses and a nightly attendance at them of 400,000.

THE fund raised in Stockholm for a wedding gift to Prince Gustavus Adolphus on behalf of that city amounts to 3,300*l.* The fund committee have decided to purchase a suite of dining-room furniture made in Stockholm.

THE Newcastle-upon-Tyne Corporation have been recommended to carry out works estimated to cost 89,000*l.*, which include partly rebuilding the quay wall and the construction of railway sidings.

THE bridges committee of the London County Council propose to recommend the temporary employment in the engineer's department of a resident medical officer at a salary of 400*l.* a year in connection with the construction work under compressed air at Rotherhithe tunnel.

THE Middlewich District Council, in order to obtain a water supply sufficient to free the district from the shortage which has occurred in times of drought for a considerable number of years, has put in the hands of a contractor the work of boring for water at Delamere.

THE sewage purification works at Penicuik, N.B., have been formally opened. Commenced eighteen months ago, and completed at a cost of over 4,000*l.*, the works were designed by Messrs. Middleton, Hunter & Duff, M.M.Inst.C.E., Westminster and Edinburgh, and carried out by Messrs. Stirling & Kinniburgh, Glasgow.

THE new Busbie Muir reservoir, constructed to provide an additional supply of water for the burgh of Ardrossan, was formally opened on the 26th ult. The reservoir, which cost upwards of 15,000*l.*, is calculated to hold between 70 and 80 million gallons of water. The engineer was Mr. W. R. Copland, Glasgow.

MR. HILL, consulting engineer to the Talla Waterworks, has reported to the Edinburgh and District Water Trustees that the construction of a breakwater at the Talla reservoir was unnecessary. The estimated expenditure was 5,000*l.* The object of the breakwater was to secure one end of the

embankment against the wash of the water in times of storm.

For the annual outing of the members of the National Association of Plumbers (Birmingham District) Rhayader was selected. About 120 ladies and gentlemen attended, including Mr. W. Cowen, president, and Mr. Whittington, secretary. The reservoirs for the Birmingham water-supply were described by Mr. Lee. Luncheon was served at the Lion Royal hotel.

THE Halifax Corporation have obtained powers to construct tramways to Wainstalls, four miles from the centre of the town. They decided, however, to run motor buses for the present on that route, and applied to the Board of Trade for permission. A reply from the Board has been received stating that the Board are not empowered to give the authority desired.

THE Metropolitan Asylums Board opened last year a home for children in Rustington, near Littlehampton. A report has since been obtained from Sir W. Broadbent as to alterations necessary to render the buildings suitable for tuberculous cases. Messrs. Rowland Plumbe & Harvey, the architects of the home, have prepared plans in accordance with the suggestions. The cost is estimated at 3,000l.

SIR W. E. M. TOMLINSON, M.P., and Mr. Rowland Barran, M.P., who had charge of the Canal Bill, which could not reach a second reading last week in the House of Commons, state that a meeting of members of Parliament representing the principal trade organisations has resolved to organise a strong deputation to wait upon the Board of Trade to press upon the Government the urgent need of taking steps to improve the inland waterways of the country.

THE George N. Pierce Company, Buffalo, U.S.A., have arranged a prize competition with a view to developing the æsthetic side of motor-car construction. The prizes offered are as follows:—(1) For the best design of a body for an enclosed car. First prize, 250 dols.; second, 100 dols. (2) For the best design of a body for a touring car. First prize, 250 dols.; second, 100 dols. (3) For the best colour scheme for any motor-car. First prize, 200 dols.; second, 100 dols.

THE annual meeting of the Sun Insurance Office will be held on the 17th at 63 Threadneedle Street. The report which will be read is satisfactory. The investments of the company amount to 2,343,521l. The income from investments during the year has amounted to 91,444l. 11s. 8d. After providing for the usual reserve of 40 per cent. of the premiums to cover liabilities under current policies, a balance of 117,909l. 5s. 3d. remains, which has been transferred to the credit of the profit and loss account.

THE Simplon Tunnel, although longer than the St. Gothard, has cost less. According to the *St. Galler Tageblatt*, the Simplon cost, up to December 31, 1904, the sum of 2,689,000l., which will be raised by outlays during the current year to 3,020,000l. This represents the entire cost of construction. At present, however, the Simplon is a single-track tunnel, with a parallel boring which the engineers—Messrs. Brandt, Brandau & Co.—have contracted to convert into a second tunnel whenever desired for a sum of 780,000l.

THE Phoenix Bridge Company of Phoenixville, Pennsylvania, is now completing, says the *Glasgow Herald*, the plans for the construction of the largest steel span bridge in the world, which is to be erected over the St. Lawrence river, near Quebec. The cost of the structure will be 3,800,000 dols. The actual work of construction will be commenced this summer, and the bridge is to be open for traffic the first day of 1909. The bridge will be 2,800 feet long between centres of anchorage piers, and its superstructure will weigh 40,000 tons. There are two 500-foot anchor arm spans and one 1,800-foot cantilever span over the channel.

For the second time in two years a poll was taken last week on the question of the erection of the new municipal offices and town hall at Hamilton, N.B. Along with the public library recently started, the offices and hall form part of a design for the whole scheme of buildings on the site in Cadzow Street. The cost of the library is 15,000l., while that for the offices and hall is estimated at 38,000l. The following questions had to be answered:—(1) Are you in favour of the new town hall and municipal buildings being erected; and (2) are you in favour of the site in Cadzow Street? The result showed a majority of "Noes" on each question.

THE Aberdeen Town Council last week inspected the tunnel in course of construction under the Dee in connection with the Girdleness outfall sewage scheme for the city, which is estimated when finished to cost about 200,000*l.* This important engineering work, of which we gave an account in our issue of the 19th ult., is progressing rapidly and satisfactorily, and a week or two now ought to see the completion of the tunnel proper. The party were accompanied by the engineer, Mr. Dyack, C.E., and the resident engineer, Mr. Conway, C.E., who described the operations.

THE new Birkenhead Corporation depôt and stables, occupying about three and a half acres in Cleveland Street, have been opened. The Corporation will engage its own men, and the team labour required will be provided from the municipal stables. The main depôt is for the storage of materials used in road improvements and works of a similar nature. According to the official estimate, the total cost of the land, buildings, machinery, horses and gears is a little under 33,000*l.* The work was carried out according to the direction of Mr. C. Brownridge, borough surveyor.

THE late Mrs. Sarah Charlotte Elizabeth Egginton Ernle-Drax, of Charborough Park, Wareham, Dorset, made the following clause in her will:—"It is my desire that a circular mausoleum shall be built on the slope of the hill, on the north-west side on the Cannon Clump in the park at Charborough, for the reception of the coffin. The dimensions of the mausoleum shall be 60 feet in circumference, with a dome arising 9 feet above the side walls, which are to be 10 feet high. Windows are to be placed in the dome only, and to have stained glass placed in such windows of such a colour that the light passing into the interior may look as much like sunlight as possible. A door is to be placed in the wall."

THE works committee of the Metropolitan Asylums Board presented a report on Saturday recommending the following increase of salaries, subject in every case to the sanction of the Local Government Board:—Mr. T. Cooper, first assistant engineer, 300*l.* to 400*l.* a year, rising by 25*l.* yearly to a maximum of 500*l.* a year; Mr. T. J. Codd, second assistant engineer, 250*l.* to 260*l.*, rising by 10*l.* yearly to 350*l.*; Mr. R. T. Miller, assistant surveyor, 250*l.* to 260*l.*, rising by 10*l.* yearly to 350*l.*; Mr. J. W. Fyfe, third assistant

engineer, 220*l.* to 225*l.*, rising by 5*l.* yearly to 250*l.* The recommendations were adopted by an overwhelming majority.

A NEW County Council school, accommodating about 1,000 children, has been erected in Grove Lane, Camberwell, and was formally opened by Sir William Collins, chairman of the education committee. The school buildings are two in number, one being for junior mixed children on the ground floor and for senior on the first floor. The other is a one-storey building for infants, whilst a separate block is provided for a drawing classroom and a room for practical science on the playground level. The buildings were designed by Mr. Thomas J. Bailey, the architect to the education committee. Sir W. Collins, in declaring the school open, remarked that the buildings bore evidence to the enormous experience in regard to school construction which the architect, Mr. Bailey, had accumulated during his long years of service. The value of Mr. Bailey's services to the School Board, and now to the Council, could not, he declared, be over-estimated.

WHITSUNTIDE ON THE CONTINENT.—Cheap tickets, available for eight days, will be issued by the Great Eastern Railway Company to Brussels June 7 to 10 inclusive, and June 12. Seven-day tickets will be also issued to Liège for its exhibition, *via* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning and Liège at noon. For visiting The Hague, the Rhine, North and South Germany, and Bâle for Switzerland, special facilities are offered. A corridor train with vestibuled carriages, dining and breakfast cars, is run on the Hook of Holland service between London and Harwich. From the Hook of Holland through carriages and restaurant cars are run in the North and South German express trains to Cologne, Bâle and Berlin, reaching Cologne at noon, Bâle and Berlin in the evening. For the convenience of passengers tickets dated in advance can be obtained at the Liverpool Street station Continental inquiry office. The Royal Danish Mail steamers of Det forenede Dampskib Selskab of Copenhagen will leave Harwich for Esbjerg (on the west coast of Denmark) on June 8 and June 10, returning June 13 and June 14. The General Steam Navigation Company's steamers will leave Harwich on June 7 and 10 for Hamburg, returning on the 11th and 14th.

FAIRBURN WATER SUPPLY.

THE new water supply for the village of Fairburn, near Pontefract, which has been carried out at a cost of 3,000*l.* from plans prepared by Mr. J. Waugh, C.E., of Bradford, was formally turned on by Mr. J. T. Addy, the representative of the parish on the Pontefract Rural District Council, who received from Mr. Waugh, as a souvenir of the occasion, a pretty silver flask suitably inscribed. The party afterwards sat down to luncheon at the Three Horse Shoes, Fairburn, at the engineer's invitation. The supply is obtained from what are known as the Gadmire springs, which are leased at a nominal rent from the Wesley trustees, the flow from which varies from 150,000 gallons to a million gallons per day, and as Fairburn's population is only 800, the quantity required will absorb only a small proportion of the minimum. The works have been carried out by Mr. J. W. Broadhead, the contractor, and consist of a reservoir of 100,000 gallons, a pumping-station, oil-engine and pumps, and about two miles of mains.

WHITSUNTIDE EXCURSIONS.

WE notice that an A B C programme issued by the Great Central Railway Company contains ample and admirable facilities for those desirous of spending the holiday at places reached by their picturesque and convenient route. Excursions are announced from London (Marylebone), Woolwich, Greenwich and Metropolitan stations to all the principal towns in the Midlands, North of England, north-east and north-west coast watering-places, and Scotland. Special fast trains will leave Marylebone at 12.5 midnight on Friday and Saturday, June 9 and 10, and several additional expresses will be run at convenient times on Saturday, June 10. The information has been concisely tabulated in the form of an A B C programme giving the times of starting, fares, dates and times of return, &c., for any stations, alphabetically arranged, which can be seen at a glance. Copies of this guide can be obtained free at Marylebone Station, or at any of the company's town offices and agencies.

LONDON IN 1905.

It would be difficult to find a single volume which affords so accurate a picture of London life as the "City of London Directory," published by Messrs. W. H. & L. Collingridge. The large map which precedes it is one of the best in existence, for it shows the boundaries of the wards and all the means of communication which exist above or below ground. Boundaries are difficult to ascertain, and it must have taken a long time to lay down those which are shown. The list of the institutions of the City contains not only the corporate and other bodies, but the whole of the City companies. Biographies and portraits are given of many of the civic notabilities. For business purposes the streets directory is the most important. The names of residents are not only given, but where, as in the majority of cases, only a part of a house is occupied, the floor is indicated. Time is wasted every day by people endeavouring to decipher names on notice-boards, which could easily be saved by consulting this Directory. The pages are so complete, it would be difficult to make suggestions for their improvement. The varieties of types employed remove the monotony of appearance which is generally considered unavoidable.

THE METAL TRADES.

ACCORDING to the tenth edition of Kelly's "Directory of the Engineers and Iron and Metal Trades and Colliery Proprietors," the exports of the principal descriptions of iron and steel amounted in 1903 to 61,639,378*l.*, which was nearly a million in excess of 1902, and more than two millions beyond 1901. The imports of iron and steel in 1903 amounted to 8,662,400*l.* These figures are enough to indicate the importance of the various industries which are dependent mainly upon iron and steel. The representatives of the trades in all the towns, however small, in England, Scotland and Wales, are given in the Directory, as well as those of the principal towns of Ireland, the Channel Islands and the Isle of Man. It is a difficult task to discover the smiths' or the general shops in which ironmongery is sold in a little village which may not have more than a hundred inhabitants. But all are to be found in this comprehensive work. How it is accomplished is explained

INTERESTING TO ARCHITECTS.

The "**HERMETICA**" **RADIATOR** (Patented). For Rooms, Halls, Offices, Schools, Shops, &c. Requires no furnace and no replenishing with water. Each Radiator is self-contained. No trouble, no smell. Next to no cost for working. Railway companies use it for Waiting Rooms. The L.C.C. use it for Board Schools.

n the preface as follows:—"Of the time and labour consumed, and the expense incurred in compiling this work, some idea may be formed from the fact that all the places in the list immediately following have been visited, and particulars relating to each firm been personally taken by agents selected for the purpose, and the information thus collected has been subsequently compiled and arranged in the various forms in which it appears, so as to enable every person to find without difficulty or delay any matter to which he wishes to refer." The company endeavour to make each year's Directory thoroughly representative. It is not only indispensable for all engaged in the various trades into which metals enter, but it can be used with confidence in the accuracy of every one of the pages.

METROPOLITAN COTTAGE BUILDING.

THE London County Council have found that the cottages on the White Hart Lane estate, Wood Green, are slow letting. One of the causes is supposed to be the erection of other buildings in the neighbourhood. Another difficulty is the absence of shops, which the Council will, however, shortly provide. The housing of the working classes committee of the Council in their last report say that arrangements have recently been made for letting part of the unoccupied land in allotments. Thirty-seven plots have been staked out for this purpose, and of them twenty-nine have already been let. It is gratifying to know that the letting of the cottages is proceeding more rapidly, and that tenants remain longer in occupation.

With regard to the cottages themselves, we have considered whether it is not possible to reduce the cost of construction so as to let cottages on the estate at a lower rental. To this end we instructed the architect to modify the plans of the dwellings, to simplify the specification, and to obtain tenders, without bills of quantities, from builders accustomed to erect houses of a similar class. The result has been eminently satisfactory, and we are able to report that prices have been obtained which are much lower than any before presented to the Council, and will enable the houses to be let at lower rentals.

The tenders received are for twenty-eight first-class or

five-roomed cottages, eight second-class or four-roomed cottages, and twenty-four third-class or three-roomed cottages, each cottage being also provided with a scullery and the usual conveniences. The lowest tender is that of Mr. G. E. Pulford, and the prices he has quoted for each type of cottage are as follows:—

First-class cottage 228*l.*, or 235*l.* for each corner cottage.

Second-class cottage 183*l.*, or 188*l.* for each corner cottage.

Third-class cottage 153*l.* 10*s.*, or 158*l.* for each corner cottage.

Mr. Pulford stipulates that payments shall be made to him every fortnight to the extent of 80 per cent. of the value of the work done, that 15 per cent. shall be paid on the completion of each house, and that the remaining 5 per cent. shall be paid within one month after the completion thereof. We may remind the Council that the adoption of such scale of payments would not comply with the standing orders of the Council relating to retention moneys under contracts, but having regard to the special circumstances in this instance, we are strongly of opinion that the conditions of contract should in this respect be varied, and we have accordingly asked the finance committee to make the necessary arrangements.

On the lines now suggested, we feel sure that the Council will be safe in proceeding with further blocks of cottages, whereas to allow the estate to remain undeveloped because of a few initial difficulties would be impolitic, and would delay the return for the capital outlay incurred, which can only be realised by proceeding with reasonable care to carry out a well-matured scheme of development.

The question of delaying building operations for a time was considered by us, but this course was thought inadvisable. The difficulties encountered are none of them insurmountable, and it is believed that they can and will be overcome, many of them as the result of further development, and others by the action we are taking to that end.

We have forwarded to the finance committee an estimate of 13,919*l.* in respect of the cost of the erection of the cottages, together with the cost of articles to be bought direct and professional charges, and we recommend—(a) That Standing Order No. 217, relative to retention moneys

under contracts, be suspended in so far as may be necessary to enable the Council to consider the subjoined recommendations. (b) That the estimate (No. 4,499) of expenditure on capital account of 13,919*l.*, submitted by the finance committee be approved, in respect of the erection of sixty cottages on section B of the White Hart Lane estate. (c) That expenditure not exceeding 13,919*l.* be sanctioned in respect of the erection of twenty-eight first-class, eight second-class and twenty-four third-class cottages on a part of section B of the White Hart Lane estate; that the tender of Mr. G. E. Pulford be accepted for the erection of the cottages by day work at the rates of 228*l.*, 183*l.* and 153*l.* 10*s.* for each first-class, second-class and third-class cottage respectively, with additional allowances of 7*l.*, 5*l.* and 4*s.* 10*s.* respectively for certain corner cottages; that payments to the extent of 80 per cent. of the value of the work done be paid, upon the architect's certificate, to Mr. Pulford in fortnightly instalments; that a further 15 per cent. of the value be paid on the completion of each cottage, and that the remaining 5 per cent. be paid within one month after the completion of each cottage; that the solicitor do prepare and obtain the execution of a contract to give effect to the tender; and that the seal of the Council be affixed to the contract when ready.

NEW FURNACES AT PARKGATE.

The new blast furnace plant of the Parkgate Iron and Steel Company, Ltd., Rotherham, was successfully started last week, and marks a further important development in connection with this old-established and widely known undertaking. The plant, which consists of two blast furnaces, with the necessary Cowper stoves, with a Gjers & Harrison equaliser between the furnaces and stoves, is of the most modern type, and, says the *Sheffield Telegraph*, embodies all that is known of the best practice of this country, America and the Continent. In addition there are many novel features, which it is believed are improvements on existing methods. The stoves are, of course, heated by the waste gases of the furnaces, and these waste gases are also employed for driving the blowing engines—gas-engines of the

Körting principle. Material is fed into the furnace automatically, the coke, ore, &c., being shot into a skip at the bottom of an inclined hoist. The skips are elevated by electric winding engine, automatically stopped at the proper place at the top of the furnace, and tipped into the distributing hopper. This hopper drops the charge on any part of the bell that may be desired. When fully charged the bell, which is also operated electrically, is lowered, and after discharging its load, rises automatically to its place again, remaining in position until it is necessary to lower another charge into the furnace. Sounding rods are provided on the furnace top, by lowering which the depth at which the metal stands below the bell can be readily ascertained. All these operations—hoisting, tipping, distributing, lowering the bell and sounding for the depth of the charge—are performed by one man stationed in the weigh-house near the foot of the incline. He has placed convenient to him a series of electric switches, and in front of him in a glass case there is a miniature presentment of the top of the blast furnace, so that when he actuates a switch, say, for the purpose of lowering the bell he sees the metal bell in front of him fall and rise in the same way and at the same time as the tune bell does at the top of the furnace. Similarly, when he turns the switch lowering the sounding rods the miniature sounding rods before him are also lowered, and indicate on a scale the number of feet at which the charge stands below the bell. In fact, except for the necessary operations of bringing forward raw material and tapping the molten iron, the furnaces are practically automatic. The gas and chimney valves are of the new type, and have been arranged not only for facility of operations, but to prevent leakage. The dust catchers are specially designed to give very complete dust separation. The gas mains also contain further dust separators and scrapers, which continually remove the dust while the furnace is in operation. A further cleansing of the proportion of gas which goes to the gas-engine is effected by washing and scrubbing, until it contains rather less gas in suspension than the atmosphere we breathe. It is early yet to speak of production, but there is no doubt that these furnaces will add largely to the output of pig-iron at the Parkgate works. It is ultimately intended to take the molten metal direct to the steel furnaces, and preparations are being made with this object in view.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of MESSRS. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

HOVE.—Aug. 1.—Designs for new free library, not to exceed 10,000*l.* (exclusive of furniture). Premiums of 50*l.*, 30*l.* and 20*l.* Further particulars, Mr. H. Endacott, town clerk, Town Hall, Hove.

PERTH.—Aug. 1.—Plans for (1) reconstruction of the existing city hall at a cost not exceeding 6,000*l.*, and (2) erection of a new hall at a cost not exceeding 15,000*l.* Premiums will be awarded authors of plans placed first, second and third in order of merit as follows:—(1) For reconstruction, 30, 20 and 10 guineas respectively; (2) for a new hall, 50, 30 and 20 guineas respectively. Instructions, general conditions and plan of site from Mr. John Begg, town clerk.

CONTRACTS OPEN.

ANCROFT.—June 13.—For the improvements, comprising new windows, clock-room, conveniences, drainage and road-making, &c., at the Ancroft, Scremerston Council school, Northumberland. Mr. J. A. Bean, county surveyor, Moot-hall, Newcastle-on-Tyne.

WARMINSTER.—June 14.—For the erection of a fire station in the Close Road, Warminster. Mr. Chas. H. Lawton, surveyor, Warminster.

WOKING.—June 20.—For alterations and additions to the infants' department of the Council schools at Westfield, Woking, Surrey. Messrs. Jarvis & Richards, architects, 36 Victoria Street, Westminster, S.W.

A LARGE block of business premises, consisting of ten shops and upper parts, is being erected with a frontage of 203 feet to Uxbridge Road, and return frontages to Bloemfontein and Ormiston Roads. Owing to differences with the County Council as to the frontage line the work had to be suspended for some time, but is now being rapidly pushed forward. Messrs. L. Whitehead & Co., Ltd., are the contractors for Mr. Ralph le Butt. Messrs. Palgrave & Co. are the architects.

AN imposing building consisting of a block of offices and business premises to be called Parliament Chambers, and facing the Church House, Great Smith Street, Westminster, is now being completed for Mr. E. J. Read, of the London Banking Corporation. The property consists of over one hundred offices and is handsomely fitted. The entrance halls are panelled with Irish green and black Devonshire marble, and the steps are of white Sicilian marble. The elevation is carried out in red bricks with carved gauged work and tawny terra-cotta dressings. Messrs. L. Whitehead & Co. are the builders, Messrs. Palgrave & Co., architects, and Mr. Farrell the clerk of works.

TRADE NOTES.

MESSRS. McDOWALL, STEVEN & Co., LTD., of London, Glasgow and Falkirk, have secured the contract for a large portion of the sanitary fittings for the Carlton Hotel, Johannesburg. Their cast-iron vitreous enamelled baths and lavatories are being supplied for the bath-rooms throughout this hotel.

The isolation hospital, Selby, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, Manchester grates and special ventilators.

R. J. NICHOLSON & Co., 26 Cannon Street, Manchester, have been appointed sole agents in Manchester and district for Messrs. Joseph Richmond & Co.'s lifts and cranes.

A NEW material for flooring called "Torgament" has been introduced in London. The works are in Leipzig, Dresden, Berlin; and in Germany it is used for public and private buildings. The advantages claimed for it are numerous. The flooring is jointless, durable and dry. It can be laid on wood, bricks or concrete. The appearance is pleasing. It also takes a high polish.

THE Furnishers' Chamber of Trade has been organised to protect and promote the interest of those engaged in the furnishing trades by forming a centre for combined action and a furnishing trade parliament. The names of several well-known gentlemen appear on the committee, and a prospectus has been issued stating in full the objects of the Chamber. The subscription is fixed at 10s. per annum, and the secretaries are Messrs. A. H. Botwright and H. E. Binstead. The offices are 14 City Road, E.C.

NEW CATALOGUE.

ANYONE who is not acquainted with the "Kinnear Patent Steel Rolling Shutters" or with the uses to which they can be applied need only glance at the illustrations which are in Messrs. A. L. Gibson & Co.'s catalogue. All are from buildings in which the invention is employed. The Corporations who own tramways have shown common sense by employing the shutters in their depôts and in that way saving space as well as money. There is no need of wasting time in opening and closing gates or risk of accident. The shutter can be raised or lowered, and when down there is absolute security within the enclosure. It can also be used with advantage in large warehouses or other premises where there are openings to be protected. At the Brighton electricity station there is a single curtain measuring 22 feet by 33 feet 4 inches, or 733 superficial feet, which one man can easily raise or lower. The hoisting machinery is simple and not liable to get out of order. The catalogue also describes the B. and S. folding gates, by which also space is economised; the elegant art-metal lift cars, special power lifts and the interlocking rubber tiling, which is a boon to all who suffer from noisy steps.

A BILL has been introduced in the Cape Parliament to provide for the raising of a loan of 144,300*l.* for the purpose of harbour works at Port Elizabeth, East London and Mossel Bay. Of this sum 104,100*l.* is proposed to be spent at Port Elizabeth, including 50,100*l.* for tugs and lighters, 9,500*l.* for warehouses and sheds, and 2,800*l.* for patent slip (additional). The intended expenditure at Mossel Bay includes 5,400*l.* for a new iron jetty.

WE are requested to announce that the Commissioners of H.M. Works intend, with the assistance of the Coal Smoke Abatement Society, to carry out during next autumn a series of tests of open domestic fire-grates. Manufacturers who may be desirous of having stoves tried should send full particulars thereof addressed to the Secretary, H.M. Office of Works, London, S.W., on receipt of which the Commissioners will determine whether such stoves shall be submitted to tests. Conditions will thereafter be furnished. Applications must be received not later than July 7 next.

PATENT INTERLOCKING RUBBER TILING.

ARTHUR L. GIBSON & CO., 19, 20 & 21 Tower St., Upper St. Martin's Lane, London, W.C.

VARIETIES.

THE first fire tests at the British Fire Prevention Committee's new testing-station will be conducted on Wednesday, June 28, and there will probably be a private view of the testing-station prior to the tests.

AN international exhibition of domestic art, with a section for hygiene, will be held at Brussels from September 2 to 20. The profits will be devoted to charity. Count P. de Smet de Naeyer is to be honorary president.

THE Eastbourne Town Council have been informed that the municipal motor omnibus service was run at a loss of 1,000*l.* during the past year. Many of the 'buses will be converted into water-vans and dust-carts.

THE Liverpool Corporation on the 2nd inst. paid to the solicitors of Mr. W. H. Lever a cheque for 138,449*l.*, this being the sum awarded by the umpire in respect of the acquisition by the Corporation of Mr. W. H. Lever's Rivington Hall estate.

THE Sheffield city surveyor recently invited designs for the erection of arches, which must be accompanied by a specification stating the materials to be used and method of construction, and an estimate of the cost. The occasion is the visit of their Majesties the King and Queen.

It is hoped within the next month or two to complete the arrangements for the erection of the bridge across the Ribble, which will provide direct communication between Southport and Lytham. Most of the land has already been acquired. The span of the bridge will be 600 feet.

THE Hammersmith Borough Council have approved a scheme for the widening of King Street, from the Broadway to Waterloo Street, at an estimated cost of 337,000*l.* This is part of the main thoroughfare leading from Piccadilly to the western districts which has been considerably widened near Kensington Church.

THE Tower Building, 50 Broadway, the first steel skeleton structure ever built in New York, has been recently sold to a syndicate which has purchased also the adjoining parcels, 46 and 48 Broadway. It is reported that on the combined plots a twenty-storey office structure to cost 1,500,000 *dols.* will be erected. The building was erected in 1888 according to the designs of Mr. Bradford L. Gibert.

THE Wolverhampton Board of Guardians are about to ask the consent of the Local Government Board to the borrowing of 4,020*l.* from the Ecclesiastical Commissioners to complete the payments on account of the erection of the new workhouse. The total expenditure on the workhouse is 195,647*l.*

MR. COWAN, Local Government Board Inspector, has fixed June 16, at the City Hall, Dublin, to hold an inquiry into the application of the Corporation for further loans amounting to about 30,000*l.* for a new scheme for the disposal of the city refuse, and in connection with the conversion of the Fairview slob into a park.

THE Barrow Town Council have received seventeen tenders for the construction of the bridge across Walney Channel to connect Vickerstown with the mainland. These were referred to Sir Benjamin Baker for report. The estimates range from 80,000*l.* to 100,000*l.*, exclusive of the approaches.

THE Lancashire Asylums Board have agreed to a recommendation that a further sum not exceeding 30,000*l.* for extras, and to complete the asylum buildings at Winwick asylum, be granted out of the asylum's fund. The Board are considering the advisability of erecting an asylum of cheap construction at Whalley.

THE Inverness Town Council on Monday resolved not to adopt electricity for street lighting or for the lighting of the town hall buildings on the score of expense and the effective nature of the incandescent light. Electric works are in course of being carried out in the burgh at a cost of over 20,000*l.*

THE Smethwick Town Council have decided to forward a memorial to the Local Government Board asking their sanction to a loan of 15,000*l.* to erect the new municipal offices upon land adjoining the Victoria Park at Bearwood Hill. The Local Government Board have just sanctioned the raising of a loan of 27,000*l.* for street paving and other purposes.

At the last meeting of the Saddleworth Rural District Council the medical officer of health called attention to the unusual number of cases of pneumonia which had occurred in the district. They were due, he said, to the sudden climatic changes and the resulting amount of dust. The

dust of the roads, he added, was dangerous to both man and beast, and he recommended the use of some kind of oil which would bind the particles together.

THE Cheap Cottages Exhibition has received from the Board of Trade a certificate as an Industrial and International Exhibition. If therefore exhibitors give notice to the Comptroller they can avail themselves of the protection afforded by the Patents, Designs and Trade Marks Act, 1883, for any inventions, designs, &c., which they may exhibit.

BIRKENHEAD recently received an offer of a free library from Mr. Carnegie, but so much difficulty arose over the question of site that the project almost fell through. Mr. Lever has offered a splendid site in the heart of the town, and it has been accepted by the library committee. Mr. Lever insists that the plans must be submitted to him and altered as he desires; also that the whole of the 15,000l. promised by Mr. Carnegie shall be spent on books alone.

At the last monthly meeting of the Dundee Town Council a recommendation of the public health committee to send Convener High and Dr. Templeman to London to attend the Royal Institute of Public Health was discussed. It was moved that no deputation be sent, on the ground that such a deputation was illegal, and that it was not worth the expenditure. By fourteen votes to seven it was agreed that the deputation should be sent.

A SCHEME for the supply of water to the village of Gowober has been submitted to the Oswestry Rural District Council by Messrs. Berrington, engineers, Wolverhampton. They recommend that water should be obtained from the Liverpool Corporation mains at an estimated cost of 6,475l. The present water supply is very bad, and two Local Government Board inquiries have already been held on the subject.

THE Gare bridge across the Eden at Guardbridge, Fifeshire, is being renovated. The northern parapet on the east side has been rebuilt from the arch, and operations on the western side are being actively pushed on. The Gare bridge, as it is called, was constructed in the beginning of the fifteenth century by Bishop Henry Wardlaw, the founder of the University of St. Andrews, and was declared

by Dean Stanley in one of his visits as great an engineering feat for the fifteenth century as the Tay bridge was for the nineteenth.

AN housing conference for Lancashire and Cheshire will be held on the 24th inst. at the hall of the Co-operative Wholesale Society, Liverpool. It is said that new and special features of the housing problem as affecting the two counties, as well as from the national aspect, will be discussed. Permission to view the Manchester Corporation housing estates has been granted, and the members of Parliament for the two counties are being invited to the conference.

MR. S. F. EDGE has made arrangements for a series of tests designed to show the comparative control of motor and horse-drawn vehicles. The following vehicles will be opposed to each other for the purpose of the competition:—Two-ton lorry *v.* two-ton horse-drawn railway van, 30-h.p. landaulette *v.* horse-drawn carriage, 15-h.p. touring car *v.* butcher's cart, 90-h.p. racing car *v.* trotting sulky. Each couple will be tested three times and be required to stop in the minimum possible distance when travelling at identical speeds.

THE Commercial Intelligence branch of the Board of Trade have been notified by H.M. Consul-General at Antwerp (Mr. E. C. Hertslet) that the municipal authorities of that city are calling for tenders for the supply of a heating apparatus in a school in the Rue Louise, Antwerp. The adjudication will take place on June 20, and a deposit of 500 francs (20l.) will be required to qualify any tender. The conditions of the contracts may be obtained from the Hotel de Ville, Antwerp.

THE opening service of the Breachwood Green Baptist church, Welwyn, Herts, took place on Wednesday, June 7. The building, which is of late Gothic in design, faced externally in red bricks, will accommodate about 420 persons, has two vestries and two classrooms in connection therewith, and has been erected under contract for 1,513l. inclusive of seating, heating, lighting and everything complete. Messrs. George & R. Palmer Baines, 5 Clement's Inn, Strand, London, W.C., are the architects, and Messrs. Frederick Wood & Co., builders, Luton, were the contractors.

ARCHITECTURAL PHOTOGRAPHERS

To H.M. the King, H.M. Office of Works, H.M. Office of Woods and Forests, the London County Council, &c.
PHOTOGRAPHS TAKEN AND PROOFS DELIVERED SAME DAY. Price Lists and Estimates Free. 50,000 ARCHITECTURAL AND DECORATIVE VIEWS.
147 STRAND, LONDON, W.C. (FIRST FLOOR.)

THE foundation-stone laying ceremony of the new buildings for the Long Eaton Primitive Methodist church and schools took place on June 6. The church (which is the portion of the scheme at present in course of erection) is designed in a late period of Gothic. A bold tower is a feature at one corner. The building will seat 500 persons. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5 Clement's Inn, Strand, W.C. The contract amount is 2,544*l.* and is let to Mr. John Bull, of Long Eaton.

ONE of the many actions arising out of the heavy rains of June 1903, which overflowed the river Lea, and inundated various parts of Essex, came before Mr. Justice Kennedy on the 5th inst., when a firm of linoleum makers sued the Metropolitan Water Board for damage caused to their premises by flooding. The plaintiffs claimed that the damage was due to the way in which the Board had constructed a large reservoir, but his Lordship held that the extraordinarily heavy rains were the cause of what had happened, and entered judgment for the defendants.

A PUBLIC meeting of Scotch fishermen, held on Saturday at Stornoway, passed the following resolution:—"That this meeting of fishermen from all parts of Scotland approves of the report issued by Mr. G. Woolfe Brenan, civil engineer, Oban, for the proposed harbour at Portnaguran, as recommended by the Walpole Royal Commission of 1889, and petitions the Government in favour of the construction of the harbour for the preservation of life and property, as the erection of small piers and boatslips is a mere waste of public money."

In deference to a superstition which has prevailed for many years, there was on Thursday of last week a complete cessation of work at Lord Penrhyn's quarries at Bethesda, where 4,000 men are employed. The superstition owes its origin to a succession of fatal accidents on Ascension Day. Some years ago the management succeeded in inducing the employés to remain at their posts, but, strange to relate, a fatal accident occurred, and now not a single quarryman will venture into the workings on what is locally known as Holy Thursday.

THE property surveyor to the Newcastle Corporation, reporting upon the receipts from the workmen's dwellings in Walker Road and Albion Row, states that the gross rent of the Albion Row property is 262*l.* 12*s.*; the actual rent received for the year ending May 1 was 199*l.* 18*s.* 3*d.*, and the disbursements were 125*l.* 16*s.* 11*d.* The gross rent at Walker Road is 610*l.* 2*s.* 8*d.*; actual rent received for the year ending May 1 was 539*l.* 10*s.* 4*d.*, and the disbursements were 210*l.* 9*s.* 10*d.* The total gross rental was therefore 872*l.* 14*s.* 8*d.*; the outgoings for the year were 336*l.* 6*s.* 9*d.*, the interest and redemption charges 667*l.*, a total of 1,003*l.* 6*s.* 9*d.*, giving a loss of 136*l.* 12*s.* 1*d.*

THE Birmingham housing committee have decided to send a deputation to Germany to study the town extension schemes which have been adopted by several of the large cities in that country. The itinerary has not yet been definitely fixed, but the German capital will be visited, and it is not unlikely that Stuttgart, Frankfort and Düsseldorf will be included in the tour. In these and other towns the German system of dealing with the housing problem has been very extensively adopted, and the committee hopes that the deputation will be able to acquire information which will be of service when the committee comes to deal with the Bordesley Green site.

THE district committee of the Lower Ward of Lanarkshire reported on the 5th inst. that one of the members, when recently in London, had got Dr. Douglas, M.P., to bring before the Postmaster-General the objections of the committee to the continuance of telegraph poles and wires on the main roads in the district. The Postmaster-General had replied that if the district committee were prepared to bear the expense, amounting to about 2,000*l.*, of removing the wires from the roads to the railway line, he might arrange to have the work done. It was pointed out, however, that the committee had no power to spend public money on such work, and it was agreed to continue the pressure on the Postmaster-General to have the poles and wires removed from the public roads.

THE Watford Town Council have made a special arrangement in connection with the construction of the

tramways which is about to commence. The consulting engineers are to reduce their fee from 5 per cent. to 4 per cent. in consideration of the town surveyor supervising the laying of the track. The Council have voted 200*l.* to the surveyor as extra remuneration. It was said at the last meeting that the surveyor would attend to his ordinary duties during the day, and would be astir at six o'clock in the morning looking after the tramway, and would again be inspecting in the evening. The undertaking will cost between 90,000*l.* and 100,000*l.*, and a "construction-lease" arrangement has been made, the contractors agreeing to operate the tramways and pay the capital charges and 20 per cent. of the surplus profits. At the end of five, ten or fifteen years there is an option in favour of the Council only of determining the lease.

It has been resolved to make a grant-in-aid of the funds of all district and local boards throughout India equal approximately to one-fourth of their income from rates or cesses imposed upon the land. It is estimated that this will cost 56½ lacs per annum, and the amount will grow as the income from cesses increases. It is a general complaint that the resources of the boards are incommensurate with the duties imposed upon them, and throughout a great part of India, from sheer want of funds, it is impossible to make adequate provision for their roads and bridges, for their hospitals and dispensaries, for their schools, for water-supply and sanitation and for veterinary aid for cattle. The Government hope that the substantial assistance now given to the boards will afford them the means of effecting material improvements in all these branches of their administration.

The chief surveyor of main roads to the Staffordshire County Council states in his report that the development of tramways in rural roads has compelled the Council to strengthen the macadamised parts on either side of them. In the surveyor's opinion the Heavy Motor-car Order will increase and develop heavy motor traffic, and it will enable these vehicles to travel at an increased speed. Heavy traction engines and heavy motors travelling at their present slow pace do incalculable damage even to the strongest and best-constructed roads. With the quickening of the speed, however, the wear on the surface will be very

much increased, as the impact of the wheels against the surface of the roads will not only fracture but disturb the metal crust and thereby loosen the surface, making it less impervious to wet and less able to bear succeeding traffic.

BUILDING AND BUILDERS.

MESSRS. PATMAN & FOTHERINGHAM, Limited (James F. Parker managing director), of Theobald's Road, W.C., and Park Street, Islington, N., are making progress with the officers' quarters, &c., at Whale Island, Portsmouth, for the Admiralty.

THE Hereford Town Council on Tuesday agreed to spend 1,000*l.* in making alterations to St. Peter's school, also to erect an infant school to accommodate 200 children on the site adjoining the present school at Holmer.

THE Board of Education have written to the Stoke education committee approving of the plans proposed for the erection of a new department for 390 boys at Harpfield. Messrs. Lynam, Beckett & Lynam have been instructed to prepare quantities and advertise for tenders for the erection of the school.

SIR JAMES STEEL, first bart., of Murieston, Edinburgh, and of Torpichen Street, Edinburgh, builder, ex-Provost of Edinburgh, bequeathed one-twelfth of his estate for employes and servants and the Trinity Hospital. The amount available for these bequests probably exceeds 80,000*l.* The total value of the estate has not yet been ascertained; it probably exceeds 500,000*l.*

At the Highgate Police Court recently a builder was summoned by the Hornsey Town Council for rates for an advertisement hoarding. The hoarding was a board announcing houses to be let or sold, and was rated 10*l.* gross and 9*l.* rateable. The defendant contended that it was not a hoarding within the meaning of the Act. Mr. Burt upheld that contention and dismissed the summons, saying the overseers knew what to do if they were not satisfied.

THE foundation-stone of the new town hall, with fire station, at Sutton Coldfield has been laid. The town hall

will comprise an assembly-room which will give accommodation for some 650 people, a supper-room, cloak-rooms and other offices. The whole of this accommodation, with the exception of the platform retiring-room, has been provided on the ground floor; thus dispensing with staircases. The fire-brigade buildings include a fire-engine room, 36 feet by 30 feet, giving accommodation for three engines, with recreation-room and stabling. Between these buildings there will be a tower 60 feet high. The redsand bricks used in the construction of the building were made in Sutton, and the facings are of Bath stone. The buildings are from plans prepared by Mr. Arthur R. Mayston, of London, and are being executed by Mr. T. Elvins, of Birmingham, at an estimated cost of 10,100*l*.

ELECTRIC NOTES.

THE Eccles electrical engineer has been instructed to obtain from the Salford Tramways manager definite information as to the quantity of electrical energy required for working the tramways within the borough of Eccles.

THE Walthamstow electric tramways, which were inaugurated on Saturday, open up direct communication with Epping Forest, into which the route penetrates as far as the Woodford boundary. The system has been built at a cost of over 100,000*l* by the District Council, which will work the tramways.

THE North-Eastern Railway Company have just completed the installation on eleven miles stretch of the main line extending from Thirsk to Alne—about ten miles north of York—of electro-automatic signalling. The contract was awarded to the Hall Signal Company, of New York. The "Hall" signals are designed to enable the services of signalmen except at junctions to be entirely dispensed with, and are purely automatic, the connections being set up by the trains themselves.

In a paper dealing with the manufactures of India recently read before the Society of Arts, Mr. H. J. Tozer, M.A., stated that electric power is now being employed, and there has recently been a brisk demand for installations in the Bombay cotton mills. Calcutta and Bombay have

electric-power stations, and a large scheme is on foot for supplying it to the Punjab. The transmission of electric power from the Cauvery Falls to the Kolar goldfields for various mining and metallurgical works is an admirable illustration of what may be done elsewhere.

THE Grimsby highway committee on the 5th inst. considered a series of extensions to the present tramway system suggested by the Provincial Tramway Company. The extensions are in the Welholme and Heneage Roads districts. The company offered to carry out the improvements providing no extra rent is charged, and if the Corporation exercised their right of purchase in 1921 they should do so as a going concern, and subject to the provisions of the Land-Clauses Act. The proposals were accepted on the condition that the Corporation purchase the extensions at a valuation upon the expiration of the company's lease.

THE London County Council on Tuesday decided by a large majority that tenders be invited for the construction, or reconstruction, for electrical traction on the conduit system, of about seventeen miles (single line) of tramways in South London, at a total estimated capital cost to the tramways account of £403,876. The lines, the construction of which has been authorised from time to time, are from Camberwell Green to Lordship Lane, from Lordship Lane to Forest Hill, from Grove Vale to Stuart Road, Peckham, from New Cross Road to Catford *via* Lewisham High Road, and from Trafalgar Road, Greenwich, to a point near the Blackwall Tunnel.

THE Institution of Mining Engineers held their annual two days' session on the 1st and 2nd inst. Three out of the seven papers dealt with winding engines and gears, and a long discussion took place on the relative merits of steam and electric winding. Several speakers favoured the electric system in use in Germany and the North of France, but the majority of those present seemed to think that the economies to be effected by electricity scarcely justified the large outlay on new electric plant. Electric winding too was accounted all very well for the small and slow systems of the Continent, but the initial outlay would be enormous if electricity were applied to the deep shafts and rapid working in this country.

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS
COMBINING LENSES AND PRISMS.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

BUILDERS' EXCHANGE AND EXHIBITION.

WORK in connection with the Builders' Exchange and Exhibition, Birmingham, is progressing favourably. The opening day is fixed for June 29, and should find all in readiness for the display of nearly every conceivable material and appliance required in the building of houses and factories. The motto of the Exchange is "A house is not finished until it is furnished," and in furtherance of this view complete schemes of furnishing houses and offices will be shown. Such important matters as sanitation, hygiene, heating and lighting may be studied in the light of the most advanced scientific productions. A most complete system has been inaugurated and is being installed, whereby immediate reference may be made to the most important catalogues of the leading firms concerned in the erection and equipment of buildings, and a plan has been adopted to keep the library of catalogues replete with all the newest publications. In a city so closely connected with the manufacture of building materials and appliances, such a centre as the Exchange offers should prove of immeasurable benefit to its members and their clients, who will thus have a central place of meeting, with an opportunity of examining appliances and viewing materials, and generally conducting their business without the loss of time necessarily expended in visiting factories and offices situated at more or less distance apart.

The following are among the firms who are exhibiting:—Messrs. Mellowes & Co., Sheffield; the Wood Carving Co., Ltd., Birmingham; Hamblett's Blue Brick Co., Ltd., West Bromwich; Phillips & Sons, Birmingham; The Cannon Iron Co., Deepfields; The Perfection Window Co., Ltd., Nottingham; English Bros., Ltd., Wisbech; The Haunchwood Brick and Tile Co., Ltd., Nuneaton; Yarrow & Co., Ltd., Bolton; Albert J. Shingleton, London; The Fire Resisting Corporation, Ltd., London; Kenrick & Jefferson, Ltd., West Bromwich; Kodak, Ltd., London; Maw & Co., Ltd., Jackfield; Kaye & Co., Ltd., Rugby; The Cloisonné Glass Co., Ltd., London; Samuel Platt, Ltd., Wednesbury; Geo. Farmiloe, Ltd., London.

A most encouraging feature is the numerous applications for membership, which evinces a desire on the part of architects, builders and manufacturers to avail themselves

of the facilities which such an institution offers for co-operation. The building is centrally situated, well-lighted and adapted to its purpose.

ALL SAINTS, FISHPONDS.

THE first section of All Saints, Fishponds, was opened by the Bishop of Bristol on the 26th ult., his Lordship remarking in his address that his Church Extension Commission had provided 1,000*l.* out of the 3,200*l.* cost, but that a further sum of 3,500*l.* was required to complete a structure that, judging by the portion opened and dedicated that day, bid fair to result in one of the most beautiful of the modern churches, and one in which the parishioners would be able to feel a pardonable pride, in which Churchmen generally could join. His Lordship also drew attention to the application and suitability of natural foliage, fruit and flowers for internal adornment as well as of angel-roof corbels above the choir. The style is that of the fourteenth century, and the portion so far constructed embraces a chancel 36 feet by 24 feet, morning chapel, two vestries, organ-chamber, south-east porch and the first of six bays of nave and aisles, the whole of which will ultimately seat 700 people. The walls are of rock-faced and level bedded local stone lined with Adamant plaster, with windows and dressings generally of the Hastham Park stone, with polished Belgian marble and blue Pennant shafts for the various internal columns, with profuse natural foliage carving in their caps and elsewhere. The roofs are of open-timber description, boarded, felted and covered with brown and red mixed Broseley tiles. The floors of chancel and porch are laid with terrazzo marble mosaic, and the gangways with oak wood blocks. The nave has a lofty clerestory, and the chancel is of considerable height, and as everything connected with the warming and lighting of the whole church has been supplied, the cost of 9*l.* per sitting is a small one. The contractors were Messrs. Clark & Sons, of Fishponds, and the architects Messrs. E. H. Lingen Barker & Son, of London, Bristol and Hereford.

THE Hanley Town Council are to apply for sanction to borrow 11,000*l.* on mains, tools and meters.

A FRAIL SUSPENSION BRIDGE.

A LIGHT suspension bridge for passenger traffic having been erected over the Kilmarnock Water, the opening took place on Saturday. Immediately after the ceremony there was a rush on the part of many present to be among the first to cross the bridge, and people got on to it from both sides, with the result that there was a block, and while something like 200 people were upon it the bridge collapsed and was precipitated into the bed of the water, which, fortunately, was of no great depth. At first it was feared that there would be considerable loss of life, but, happily, there was not a single fatality, and, while eight or nine persons were injured, in no case were the injuries of a serious nature. The bridge was 70 feet long by $3\frac{1}{2}$ feet wide. The cost of its erection was about 150*l*. The suspenders were of wire ropes, with iron columns set on concrete piers and anchored to a block of concrete at either end, and was supposed to be capable of bearing an ordinary strain of about 20 tons. It is alleged that a link of one of the anchor chains had a latent defect and gave way, causing the whole strain to be thrown on one side, and thereby pulled a wire rope through the socket of the fastening block.

SOCIETY OF ENGINEERS.

At the meeting of the Society of Engineers held on Monday, Mr. N. J. West, president, in the chair, a paper was read on "The Improvement of London Traffic," by Mr. Charles Scott Meik, M.Inst.C.E., and Mr. Walter Beer, Assoc.M.Inst.C.E., of which the following is an abstract:—

The authors first refer to the exhaustive evidence collected by the Royal Commission on London Traffic and to the appointment of an Advisory Board of Engineers to assist the Commissioners, which they suggest warrant the expectation that the forthcoming report will deal with the needs of London in a comprehensive manner. This evidence shows that the traffic conditions of London are unsatisfactory, and will become worse if means are not taken for their improvement.

After remarking that considerable amelioration of existing conditions will, or can, undoubtedly be effected by an extension of the powers of the police in connection with the regulation of traffic and by the construction of local widenings, the electrification of suburban railways and the completion of the tube lines already authorised, the authors point out that more drastic measures are required to adequately relieve the present congestion of traffic and to provide for future expansion. They suggest that new main avenues should be made through London and point out that they are supported in their views by the weight of evidence given before the Royal Commission on London Traffic.

Discussing the conditions to be fulfilled by new thoroughfares or main avenues, the authors show that they must tap existing centres of traffic and extend to the more distant suburbs. To be effective they must pass over or under all important cross streets within the central area, and should provide a special track for motor vehicles. Railways and tramways must be constructed along such main avenues, not only to assist in defraying their cost, but to enable the working-class population disturbed to be economically rehoused on the outskirts of London and to assist in providing for the ever-increasing demand for rapid passenger transport to and from the central area of the Metropolis.

Realising that no useful discussion on these broad suggestions could take place without reference to concrete proposals, since the kernel of the whole matter lies in the practicability of the proposed works in regard to cost and in their effect upon business, the authors describe the scheme laid by them before the Royal Commission on London Traffic last year and offer it as a basis for the discussion of the general principles involved. Their chief proposals are for two main avenues through London from north to south and from west to east respectively. The north to south main avenue is designed to commence near Enfield and to extend through Tottenham, South Hornsey and Highbury, past the Parcels Post Office and Mount Pleasant, through Hatton Garden, across Holborn, the Strand and the river Thames to St. George's Circus. Thence through Camberwell, Lambeth and West Dulwich to the neighbourhood of Croydon.

The west and east main avenue is intended to commence

C. W. OUTRAM & CO. WOODVILLE, near Burton-on-Trent.

near Hounslow and to pass through Ealing, Acton and Notting Hill, Paddington and Marylebone, to a junction with the north and south main avenue at Mount Pleasant. From Mount Pleasant this avenue would continue eastwards *via* Liverpool Street, through Stepney, Bow Common and East Ham to the neighbourhood of Dagenham. These main avenues would together be forty-eight miles long, and the authors propose that for rather more than half their length they should be constructed with upper and lower roadways, the former passing over all cross traffic, and the whole design constituting a doubled-decked street. Each avenue would be 160 feet wide, would provide a special road for fast motor traffic, a double line of tramway and a double line of railway, the latter being situated either overhead, as in the case of the suspended railway at Elberfeld in Germany, in shallow subway immediately below the main avenues, or in tube at a greater depth.

The authors go very carefully into the important question of cost, and show that the expenditure on land could be almost entirely recouped by purchasing on both sides of the avenues land in excess of that required for the roads, and selling the surplus at its improved value. The earnings of the railways and tramways, calculated on the basis of zone fares varying from 1-12th to 1-8th of a penny per mile, would, the authors say, be sufficient to defray the expenditure on their construction as well as on that of the main avenues. Apart from the railways and tramways the total cost of the 48 miles of main avenues suggested is placed at 21,311,000*l.*, which, it is estimated, could be repaid with interest from the surplus earnings of the railways and tramways within a period of forty years and upwards from the completion of the works, dependent upon the type of railway adopted.

PROTECTION AGAINST FIRE.

A FEATURE of the Bath and West and Southern Counties Agricultural Show, held last week at Nottingham, was the very complete arrangement carried out by Messrs. Merryweather & Sons, of London, for the fire protection of the show ground.

A detachment of the Merryweather fire brigade were on duty at the fire station, which was fully equipped with the very latest in fire extinguishing appliances. Amongst the apparatus worthy of special attention may be mentioned the motor "Fire King" steam fire-engine. This engine is capable of delivering 400 gallons per minute, and of travelling at the rate of 30 miles per hour. The boiler is fitted with an improved form of liquid-fuel burner, recently patented by Messrs. Merryweather, the great advantage being that only one burner is employed, and, moreover, should occasion arise, when it is impossible or inconvenient to obtain a supply of oil, coal or wood can be burnt, and in this case no alteration of any kind is required to the burner or fire-box. We believe this feature is obtained in no other type of burner.

A petrol motor chemical fire-engine was also at the fire station ready for turning out immediately on an alarm being received.

A "Valiant" steam pump, fire escape, hose cart and a large number of smaller appliances were provided available for instant use. Amongst these might be mentioned Murphy's patent nozzle; by means of this a fireman is enabled to drive a volume of smoke out of his way and thus obtain entrance to a building which otherwise he would not be able to enter. A patent nozzle—an invention of the chief of the Edinburgh Fire Brigade—was also exhibited. By this apparatus jets of various sizes can be thrown from a branch without changing the nozzle.

Messrs. Merryweather also had an interesting exhibition of water-supply, irrigating, spraying and general pumping machinery. These included a patent portable steam spraying plant, capable of playing as many as twenty-four very fine spray jets at a time. Moreover, by means of the special spray pipes the jets can be directed on any spot and in any direction.

Another novelty in spraying apparatus was shown in a little petrol-driven machine, the motor employed being an ordinary bicycle engine.

A very useful machine exhibited was the Merryweather patent portable "Hatfield" pump and oil-engine. This can be used as a fire-engine, water-supply pump, as well as for driving light machinery.

Messrs. C. P. Kinnell & Co., Ltd., of Southwark Street, are well *en évidence* with specimens of their well-known horizontal tubular boilers, heating apparatus, patent radiators and valves, garden engines and hand-pumps.

Messrs. Hartley & Sugden, of Halifax, display the merits of their heating apparatus boilers, including specimens of cast-iron "White Rose" and wrought-welded boilers of the "Savile," "Climax," "Handy" and "Stanley" types, which are suitable for heating and hot-water supply in hotels, mansions, public buildings, &c., as well as greenhouses, vineries, &c. Radiators and valves are also shown by this firm.

We may also mention that Messrs. Doulton & Co., Ltd., are among the list of exhibitors, with specimens of Doulton and terra-cotta ware in the shape of ornamental vases, pedestals, garden pots and other articles of that class which prove so attractive.

THE NEW SHOW-ROOMS OF THE LEEDS FIRECLAY COMPANY, LTD.

THE Leeds Fireclay Company, Ltd., is the trading name of an association of several old-established and well-reputed firms in each branch of manufacture, consisting of Messrs. Joseph Cliff & Sons, the Burmantofts Co., Messrs. Edward Brooke & Sons, Messrs. W. Ingham & Sons, the Wortley Fireclay Company, Messrs. Joseph Brooke & Sons and Messrs. Oates & Green, Ltd.

The head offices of the company are at Leeds, but it has long been felt desirable that the company should have some central show-room in London where architects, surveyors and the trade as well as the public generally might view the various specialties. Advantage has, therefore, been taken in fitting up the new premises at 2 and 3 Norfolk Street, Strand, W.C., so that the application of the various descriptions of terra-cotta and faience may be displayed, and where also the many sanitary specialties of the firm may be seen in actual operation.

Upon entering the spacious show-rooms on the ground floor we noticed the excellent way in which the fittings of their various kinds are grouped together with their necessary accessories. The several types of Imperial porcelain

baths are shown, fitted to suit the varying tastes of intending purchasers or the requirements of the different water companies. Fittings are also on view for public baths and hospital fittings of the very latest design and finish. Lavatories in one slab of glazed-ware with glazed-ware legs and accessible fittings of the latest type are likewise shown.

In the lower ground-floor there are examples of the company's manufacture in closets, urinals, lavatories, wash-tubs, &c. These are all shown fitted for actual use with the water-supply laid on, thereby enabling architects and intending purchasers to thoroughly test the capabilities and efficiency of the various articles they might require. Glazed-ware mangers for loose-boxes and for stalls are also to be seen, together with patent cattle-troughs and other goods of a similar type, which tend to render stables, cow-byres and piggeries as sanitary as possible.

Various specimens, representing materials supplied and works executed by the Burmantofts branch of the Leeds Fireclay Company, are in addition displayed. Examples of constructional faiencework and fireplaces are also shown, as well as examples of their tile walling and ceiling decoration.

The manufacture of glazed and enamelled bricks in all colours is a very prominent department of the Leeds Fireclay Company, and examples of every kind may be seen in the show-rooms, to celebrate the opening of which a luncheon was given at the New Gaiety Restaurant on Monday last, at which Mr. B. J. W. Lone presided, and the toast of success to the Leeds Fireclay Company, Ltd., was enthusiastically responded to.

PLANS for the completion of the Edinburgh University Union buildings were passed at the Dean of Guild Court on the 1st inst. The original buildings were erected in 1888 and enlarged in 1902. The remaining portion of the addition about to be erected contains a library on the ground floor, a reading and writing-room over the library. The new structure as a whole will form a handsome addition to the buildings of the locality. The cost of the buildings now to be erected will be about 8,500*l.*, and tenders for that amount are about to be accepted. The plans have been prepared by Messrs. Sydney Mitchell & Wilson, architects.

JENNINGS' PATENT DUPLEX BATH VALVES

(For Hot and Cold Water Supply), and
HALF-TURN LEVER WASTE.

Upwards of 5,000 in Use in Various Parts of the Country
in Public Baths, Asylums, Hospitals, Infirmarys, Hotels,

THE

Architect and Contract Reporter.

IMPORTANT NOTICE

TO THE

ARCHITECTS & CIVIL ENGINEERS OF WESTMINSTER.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of MESSRS. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

HOVE.—Aug. 1.—Designs for new free library, not to exceed 10,000*l.* (exclusive of furniture). Premiums of 50*l.*, 30*l.* and 20*l.* Further particulars, Mr. H. Endacott, town clerk, Town Hall, Hove.

PERTH.—Aug. 1.—Plans for (1) reconstruction of the existing city hall at a cost not exceeding 6,000*l.*, and (2) erection of a new hall at a cost not exceeding 15,000*l.* Premiums will be awarded authors of plans placed first, second and third in order of merit as follows:—(1) For reconstruction, 30, 20 and 10 guineas respectively; (2) for a new hall, 50, 30 and 20 guineas respectively. Instructions, general conditions and plan of site from Mr. John Begg, town clerk.

MAY-OATWAY FIRE ALARM.

WHAT USERS SAY.

Messrs. J. Thomasson & Sons, Spinners, of Bolton write:—"A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily, 10 minutes before the Automatic Sprinkler went off." Loss £48. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works, Edinburgh, write:—"A fire broke out in our factory during the dinner hour on January 18, 1905, when the May-Oatway installation (put in since our previous fire) saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well." Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.C., Premier, writes:—"This system has been largely adopted in New Zealand, and has given the greatest satisfaction." (The Government are the largest users; protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—"Fire March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss." Claims paid, £10 and £50 respectively. What have you done to limit your loss?

Send for circular, or call and inspect 94 Paul Street, E.C.; Glasgow, Liverpool and Manchester.

WAPLER'S VENETIAN BLINDS

Are fitted with a very simple and effective Check Action. (OWN PATENT.)

Are very light and elegant in consequence of the laths being extra thin. Are as easily worked and taken down as ordinary roller blinds.

There is nothing to get out of order.

The wear on tapes and cords reduced to a minimum.

For all our Venetian Blinds we use only the very best selected Pine.

WAPLER & CO., 699 Fulham Road, London, S.W.

Over 1,000 in use.

-----------------------------	--------	---	---

TRADE NOTES.

THE directors of Waygood & Co., Ltd., are to be congratulated on being able to pay a dividend of 9 per cent. on ordinary shares. The profits earned by the company, including 6,074*l.* from last year, were 29,339*l.* 5*s.* 3*d.* A balance of 12,164*l.* 5*s.* 3*d.* has been brought forward.

MESSRS. W. POTTS & SONS have issued a sketch of the late Lord Grimthorpe, under whose direction the firm have made and erected many important clocks since 1847.

THE Hattersley-Pickard hot-air drying system has been adopted by Messrs. J. & R. Bruce for their new works at Eldwick, Bingley. As a result, timber is dried in far less time than before. By the application of a Hattersley-Pickard patent screw fan in conjunction with a steam-heating battery air is drawn. The hot air is then forced through ducts to various parts of the room and distributed throughout its whole area. Arrangements are also provided for circulating, so that when desired the air can be reheated and used over again, thereby giving an increased temperature and greatly economising the amount of steam required.

VARIETIES.

THE Light Railway Commissioners have sanctioned the construction of a railway between Maidstone and Headcorn, a distance of twelve miles.

THE Runcorn Urban Council have decided to carry out the plans for the alteration and extension of the free library provided for by the gift of 3,000*l.* from Mr. Carnegie.

A MONUMENT has been unveiled at Iselle to the memory of the workmen who lost their lives in the piercing of the Simplon tunnel. Over 3,000 persons were present.

THE Gosport Council have rejected a proposal to pave the private streets with tar-paving in favour of the use of artificial slabs.

THE Co-operative Union have decided to erect central offices in Manchester at a cost of about 10,000*l.*, inclusive of site.

A PARIS theatre has replaced all its inflammable scenery by scenes painted on galvanised iron and metallic gauze. The framework is of iron tubing.

THE Board of Education have informed the Merionethshire education committee that the school at Llanelltyd is structurally unfit, and that a new school is necessary.

THE Mersey Docks and Harbour Board have under consideration the extension of the Birkenhead Lairages, and plans have been submitted of the enlargement, which will cost 50,000*l.*

AT Flimly, a mining village near Maryport, Mr. W. Coulthard, assistant overseer, has erected a block of cottages which he lets for 3*s.* 6*d.* per week. They contain two large rooms and attic, with range, vestibule and yard.

THE Birmingham Board of Guardians have approved the recommendation from the infirmary committee asking for power to build a new nurses' home, with accommodation for twenty-eight nurses, at an approximate cost of 3,500*l.*

THE City Offices Company's new premises, Baltic House, E.C., of which Messrs. Gordon & Gunton are architects, have been completed by Messrs. Patman & Fotheringham, Ltd.

THE plans and works committee of Edinburgh Town Council recommend the erection of a police office and fire

station at Saunders Street, Stockbridge, at a cost of about 8,000*l*.

MR. C. E. EASTMAN, an American architect, has patented plans for building houses of glass. If his idea is adopted dwellings, banks and hotels will have walls entirely of opalescent wire glass, and windows will be abolished.

THE Commercial Intelligence Branch of the Board of Trade have received a copy of a notice issued from the office of the purchasing agent at Washington for the Isthmian Canal Commission calling for tenders for the supply of 3,000,000 paving bricks.

THE Lancashire education committee propose to erect new public elementary schools at Skelmersdale, to accommodate 120 children; at Edgworth, near Turton, for 200 children; and at Wroughton, near Chorley, for 200 children.

THE housing committee of the Birmingham City Council invite offers for taking on ninety-nine years' building leases about 15 acres of land situate at Bordesley Green. About 2½ acres of land in the centre of the site will be reserved and maintained by the Corporation as a recreation-ground.

FOR the summer holidays a little work issued by Messrs. Thomas Cook & Son, of Ludgate Circus, E.C., should be of service; particulars will be found therein to suit the pockets of all, and the list of places and cost is given so extensively that there should be no difficulty in selecting where to go and how to go there.

THE Bristol City Council have decided to erect the second of the two huge tobacco warehouses which the Imperial Tobacco Company need for the storage of tobacco they intend to import direct to Bristol. It is anticipated that a considerable volume of imports will be diverted as a result from Liverpool and other ports.

THE tramways department of Glasgow Corporation have issued an official penny guide to the 150 miles of tramways which they operate in the city and suburbs. A brief historical sketch of the city and of the tramway undertaking is given, and directions are furnished for a series of eighteen or nineteen tours.

At the last monthly meeting of the Sheffield Master Builders' Association the formal presentation of photos to the past presidents in recognition of their services in the chair took place. The photos are to be hung in the Builders' Exchange, and each year it is intended to add the photo of the president immediately on the termination of his year of office.

BRIGHTON has received sanction to borrow 12,038*l*. Of this 9,138*l* is in respect of the cost of the construction of concrete foundations for works of wood-paving and 300*l* is to defray legal costs. The period of repayment of the first sum is fifteen years, and of the 300*l* five years. The remainder of the 12,000*l* (2,600*l*.) is for the erection of a temporary school on land in Bates Road and Loder Road.

THE current orders in the United States for structural shapes and fabricated steel continue to run to 2,000 tons a day, while contracts for various large projects are pending. The orders now, says the *Glasgow Herald*, on hand in one department alone of the American Bridge Company exceed 400,000 tons. Large orders are being placed with the steel and iron manufacturers. The lower grades of foundry iron are weak.

THE Salford Council have agreed to apply to the Local Government Board for sanction to borrow about 8,366*l*. to be spent in repaving several streets adjoining the new dock on the Ship Canal. In contemplation of the increased traffic which would pass over the streets leading to and from the new dock—namely, Hulton Street, West Park Street and Robert Hall Street—it would be necessary to substitute granite for the present grit setts.

At the last meeting of the Oldham Town Council a long discussion took place with reference to the letting of the contract of 18,370*l*. for the erection of the new school at Clarksfield, the complaint being that the plans had not been on view to the members of the Council. An amendment

that the contract be referred back and plans submitted before further consideration was, however, defeated by an overwhelming majority.

THE Chelsea borough surveyor is of opinion that if granite chippings were used on the asphalt roads in lieu of fine ballast and sand it would materially assist to keep the roadways from becoming "greasy," and so lessen the danger to vehicular traffic. The general purposes committee therefore recommend that, as an experiment, granite chippings be used on the asphalt roadways, in lieu of ballast and sand.

THE British consular report for the year 1904 on the trade of Japan states that window glass shows a decline of some importance, the figures being 73,000*l.* as against 116,000*l.* This is attributed to the exceptional conditions of the past year. In normal years, when economy is not so much the order of the day, the demand for window glass as a substitute for the paper shoji is a constantly increasing one, and the native industry is not as yet a very formidable competitor.

LORD PROVOST SIR ROBERT CRANSTON has written to the secretary of the Edinburgh and Leith Master Builders' Association and the secretary of the joiners on strike offering his services to bring the present dispute to an end. His Lordship appeals to both parties as to whether the time has not now arrived when it is desirable to have a conference of both sides to endeavour to arrive at a settlement, and he expresses his willingness to act as intermediary in order to bring about such a conference.

THE committee who have under consideration the question of adopting means for the protection of Freshwater Bay from further encroachments of the sea, consider that it would be desirable to extend their scheme to include the provision of a small harbour at the bay for yachts, fishing and pleasure boats, &c., and sufficient assurances have been given to justify them in obtaining from Mr. W. T. Douglass, the eminent engineer, an amended report as to the possibility of a harbour being formed.

THE Aberdeen Harbour Commissioners decided on Monday that, in view of the importance of the works contemplated in connection with the harbour, it would be of advantage to have an opportunity this autumn of visiting

and inspecting the extensive dock improvements now in an advanced state of progress at Hamburg, the works there including the improvement of the navigation channel, the construction of new docks, transit sheds and warehouses, and other appliances for the quick handling of cargoes.

THE fourth municipal dry dock at Rotterdam, which was commenced in 1902, has been completed. It ranks amongst the largest in Europe. Its length is 556 feet, with a breadth of 118 feet, and its lifting capacity is 15,600 tons. The dock rests on seven pontoons, each weighing 600 tons, whilst its total weight amounts to 6,500 tons, and all the necessary appurtenances are worked by electricity supplied by a station on the left bank of the river. Its total cost slightly exceeds 100,000*l.*

IN connection with the efforts to obtain an improved water supply, the Lincoln City Council have resolved to continue the 9-foot diameter shaft for a further depth not exceeding 600 feet, at an additional expenditure not exceeding 4,000*l.*, on the understanding that the work will be carried on continuously, the actual depth to be left to the discretion of Mr. P. Griffith, engineer, and that he be authorised to prepare in advance the necessary plans and specifications for pumping machinery on the lines suggested by him with a view to having the work put in hand without loss of time, should the water be proved of good quality and of sufficient quantity.

TESTS have been made of a portion of the new river wall on the Tay at Dundee harbour to replace the existing wooden jetties. The wall is built in ferro-concrete, and the part completed has a length of 400 feet and a width of 45 feet. It is protected by wooden fenders, and the walling is built to withstand the pressure of any ship which arrives. The outer wall consists of ferro-concrete cylinders, inside of which are piles, and the gaps are filled up with concrete, while on the top of the decking is a line of rails. A huge weight of pig-iron was placed upon the structure in presence of an inspecting party, and the experiment was found to be entirely satisfactory.

THE Epsom Urban Council have received a report from Mr. Vane Graham, consulting engineer, on the extension of the pumping plant at their waterworks. The following recommendations have been approved:—(1) That the

pumping plant to be installed be of a capacity of not less than 50,000 gallons per hour; (2) that the new pump be placed in the garden well; (3) that the pumping be done in one lift; (4) that the pump be capable of raising water from the bottom of the well, *i.e.* from the level of the adit connecting the old borehole to the oval well 90 feet below the surface; (5) that the pump be of such a type as to be capable of being slung in the well from above the water level to avoid the necessity of pumping the well out while the pump is being fixed.

THE third annual conference of the Lancashire Association of Urban District Councils considered the question of the proposed lunatic asylum at Whalley. The price paid for the site was 32,400*l.* for 307½ acres, or over 100*l.* an acre for country land. According to one speaker, the site was in the drift of the Calder and had neither natural nor artificial shelter, and the soil was of such a character that it would be impossible within any reasonable period to cultivate the growth of trees upon it. It was much too low a site, and would be conducive to phthisis and other tubercular diseases. The Conference carried a motion expressing strong disapproval of the proposal and instructing the executive committee to take such steps to oppose the scheme as they considered advisable.

WE have received a copy of the summer number of *Country Life*. It contains, amongst other things, a hitherto unpublished poem by Robert Browning called "A Forest Thought," which is not only fine in itself but extremely appropriate to this season of the year. With a series of reports on the breeding places of sea-birds there are some extraordinary photographs of flying sea-gulls. The other bird-pictures show snapshots of the beautiful and scarce bearded tit in its native haunts. The house illustrated is Cotehele, a seat of the Earl of Mount Edgcumbe, and there is a most interesting article on Heron Court and the Malmesburys by the Earl of Malmesbury. Mr. George Bourne contributes one of his most charming papers. The issue is beautifully printed on good paper, and is an excellent example of British journalism.

THE Edinburgh Town Council have been recommended to make the following additions to their fire appliances under the estimates for 1905-6:—(a) A motor steam fire-

engine of 500-gallons capacity, similar to that seen in Liverpool, fitted with a chemical cylinder (the boiler to be fired by either coal or oil fuel) at an approximate cost of 1,150*l.*; (b) a turnable mechanical fire-escape capable of reaching 80 feet at an approximate cost of 600*l.*; (c) under the estimates for 1906-7—a petrol motor hose tender for first aid and other purposes, carrying all the necessary apparatus for working at both small and large fires, at an approximate cost of 800*l.*; (d) twelve small portable chemical extinguishers of 3 gallons capacity to be carried on the existing hose tenders of the brigade, at a cost of 50*l.*; (e) the substitution of rubber-lined canvas hose of 1½-inch diameter for the 1¼-inch ordinary canvas hose now used on the hose tenders, at a cost of 50*l.*

THE Carlisle Town Council have received the following report as to the Geltsdale water-supply scheme:—The total amount authorised to be borrowed under the Carlisle Water Act, 1898, is 150,000*l.*, with the cost of the Act 3,532*l.*, making altogether 153,532*l.* Of this amount 114,562*l.* has been borrowed, leaving a balance of 38,970*l.* still to be raised; 86,793*l.* 13*s.* 8*d.* has been expended, 43,987*l.* paid to contractors, 12,861*l.* for purchase of land, and 4,016*l.* 2*s.* 4*d.* for easements. The total amount of Messrs. Kennedy's contract for the construction of works is 120,377*l.* 19*s.* 3*d.*, and as they have already received 43,987*l.* there still remains to be paid to them 76,390*l.* 19*s.* 3*d.* on the amount of their tender. To this must be added the amount already paid, making a total expenditure of 163,184*l.* 12*s.* 11*d.* In addition to this expenditure there will also be Messrs. Mansergh's charges, engineer's salaries, office and other expenses, 10,000*l.*, which makes a total of 173,184*l.* 12*s.* 11*d.*, or 19,652*l.* 12*s.* 11*d.* more than the present borrowing powers.

MESSRS. W. PORTS & SONS, clock manufacturers, Leeds and Newcastle-on-Tyne, have received instructions from Councillor J. T. Whipp, J.P., the mayor of Clitheroe, and his two brothers, to erect an illuminated Cambridge quarter-chime clock and bells at the Carnegie new Free Library, Clitheroe, to the memory of two brothers drowned at sea on the *Stella*. The clock and chimes will have all Lord Grimthorpe's latest improvements inserted.

THE "HERMETICA."

ALTHOUGH the English fireplace is a national institution which is never likely to be altogether superseded, yet there are many places for which it is not suitable. As substitutes radiators rather than continental stoves are more likely to win their way in this country. One of the latest forms of radiators has been introduced by the Tubular Bath Boiler Company, Ltd. It has many advantages. In the first place, each is complete in itself, and is self-contained in operation with the exception of a small gas pipe. There is no necessity for cumbrous accessories, and as there is no fixing they need only be seen and used in winter. They cannot be considered as landlord's fixtures, which is an advantage to modern tenants. The consumption of gas will be proportionate to the temperature that is desired, and there is no effluvia. Another special feature is that their cost is measured by the number of sections employed, radiators of six, eight and twelve sections being kept in stock. The efficiency of the "Hermetica" can be judged by the following table:—

	Heating Surface.	
A 12 Sect. "Hermetica" 38 ins. high	36 sq. ft.	will heat 3,000 c. ft.
8 " " "	24 " "	2,000 "
6 " " "	18 " "	1,500 "

There can be no danger, for each radiator is tested at ten times the working pressure. The principle is described as follows by the patentees:—"The liquid sealed up in radiator is heated by gas and air burner into steam, which rises up the columns above the burner, then travels along the top tube and down the columns beyond the burner, expanding and condensing again to liquid, to be reheated into steam as before. This process continues all the time the radiators are at work, whether for weeks or years. The burner, being made in proportion to the size of each radiator, cannot raise the steam pressure to over five pounds, which causes the radiators to contain a temperature of 228 deg. Fahr., or nearly 100 deg. Fahr. more than an ordinary radiator charged with hot water can give." Lastly, the appearance of the "Hermetica" is in its favour.

ELECTRIC NOTES.

MR. CHARLES LILL has accepted the appointment of technical manager in the power department of the Armorduct Manufacturing Company, Ltd.

AN arrangement has been come to between the German and Belgian Governments for the construction of an electric railway from Bruxelles to Aix-la-Chapelle. It will pass through Louvain and Tongres.

MR. A. A. DAY, electricity engineer to the Bolton Corporation, has been offered the post of chief electrical engineer and manager of the tramways at Johannesburg. The salary is 2,000*l.* per annum.

THE Eccles Town Council have sustained a loss on the borough electricity department during the past year of 473*l.*—a sum greater than the loss of the previous year. This was due to the increased payments made for loans and interest through the extension of the mains.

THE International Power and Transmission Company, of Niagara Falls, U.S.A., has been incorporated, with a capital of 2,000,000 dollars, to supply electricity for light, heat and power purposes. The Niagara and Eastern Power and Transmission Company, of Niagara Falls, has been incorporated with a similar capital.

THE city of New York is stated to have purchased property in Long Island City for the purpose of constructing an electric-light plant for the boroughs of Brooklyn and Queens. Another plant will be constructed in Manhattan Borough, and the two plants will be connected under the river. It is proposed to light with electricity all the streets, bridges, public offices and parks.

THE Boston Town Council have rejected a recommendation from the paving and lighting committee that a London firm should be instructed by the town clerk to prepare a full report of an electric-lighting scheme for the borough for the Local Government Board, and any other work necessary to obtain the consent of the Local Government Board to the necessary loan, at a fee of 200 guineas. The supporters of the project intend to endeavour to obtain a poll of the ratepayers on the matter.

A DISAGREEMENT having arisen between the electrical department of Ayr and the cleansing department as to the value of the steam for the electrical works generated by the

destructor furnaces, the sanitary inspector submitted an elaborate report as to tests to ascertain the value of the steam. The sum charged by the cleansing department for the year was 500*l.* The electrical engineer reported that the value of steam was not more than 200*l.* The sanitary inspector's report brought out the value at 532*l.* 1*s.* 8*d.* It was agreed to remit the matter to a sub-committee for a report.

THE extensions at the Govan electricity works, N.B., have been formally inspected. In 1903 the electricity plant installed consisted of two steam dynamos of 90 kilowatts capacity each and two of 200 kilowatts each, a battery of 150 ampere hour capacity and four Babcock boilers. The Town Council then decided to make extensive additions, and the larger of two schemes—involving an expenditure of 35,364*l.*—was sanctioned. During the six years since the initiation of the scheme for electricity, their capital expenditure had increased from something like 16,000*l.* to 94,000*l.*

MAJOR C. E. NORTON, R.E., Local Government Board inspector, held an inquiry at the council chamber of the town hall into the application of the Horsham Urban District Council for sanction to borrow 5,123*l.* 1*s.* for the purposes of electric lighting. The estimate of the amount was made up as follows:—Feeders, machinery and main extensions, 3,420*l.*; works already executed, but not included in previous loans, 1,303*l.* 1*s.*; for free wiring, 400*l.* The total expended on the electric-lighting works was 23,206*l.* and the outstanding debt was 21,761*l.* The repayment of the loan applied for will be spread over twenty-five years.

MR. ALEXANDER GRAY, Edinburgh, the holder of the Engineering Vans Dunlop Scholarship of Edinburgh University and a Whitworth Scholarship, has, in the Faculty of Applied Science of M'Gill University, Montreal, Canada, been devoting himself for the session 1904-5 to the third year's course in electrical engineering, and has been placed first, with prizes, in the subjects of electrical engineering and electrical theory and measurements. Mr. Gray has entered the service of the Bullock Electrical Company of Cincinnati, Ohio, for the five months' vacation, and intends to return to M'Gill University for the fourth year and graduating course in September next.

THE Beckenham Urban District Council have decided to take over and themselves work the electric-lighting undertaking at Beckenham, now being worked by the British Insulated and Helsby Cables, Ltd. The undertaking was built on public moneys raised by loan, and was leased to the company for five years, the company agreeing to run the station at their own risk for that period, while the Council was to have the option at the expiration of the time of taking the concern over or of renewing the lease. For the first few years the business was worked at a loss, but last year the returns showed a profit of 200%.

THE Folkestone Corporation have under consideration the offers of two companies to construct tramways from the harbour through Cheriton to Shorncliffe Camp and Hythe. The Traction and Powers Securities Company proposes to put down the overhead system, and the National Electric Construction Company specifies the Dolter surface contact plan. Each company offers to pay the Town Council 15,000% towards the expense which it has incurred in widening Cheriton Road, and 1,200% to reimburse the Corporation in regard to the cost incurred in securing a provisional order to construct its own tramways. Under that order there is an agreement with the Earl of Radnor not to adopt the trolley system, and his Lordship has refused to waive his objection.

THE Louth Town Council on Tuesday approved the recommendation of the electric-lighting committee that a loan of 17,000%, in respect of the installation of electric light within the borough, should be for thirty years, and that it should be obtained from the Public Works Loan Commissioners. It is proposed in the first instance to put down two vertical oil-engines, at a cost of 1,950% each, coupled to a 75 k.w. dynamo, and a battery of accumulators. In those streets in which electric-light mains are laid it is proposed to convert the present gas street lamps to electric lamps, fitted with incandescent and three arc apparatus. The estimated cost of the works shows the necessary immediate outlay to amount to 12,230%, while prospective expenses to be incurred during the first two years bring the estimated cost up to 16,990%.

THE utilisation of electricity as motive-power in Germany is increasing much more than for lighting purposes. At the

Berlin electric works there were used (exclusive of power required for driving street cars) in 1897 for motive-power 7,224 kilowatts, for lighting 14,601 kilowatts; in 1904 for motive-power 44,448 kilowatts, for lighting 36,195 kilowatts. Within the same period the number of motors supplied increased from 2,056 to 12,933. According to a reliable estimate the number of hands employed in the German electric industry was 72,500 in 1904 (compared with only 26,300 in 1895 and 54,100 in 1898), of which number 17,500 were in the electric departments of the General Electric Company and Union group—which employs about 29,000 in all—12,000 in the electric departments of the Siemens-Schuckert combine, while the remaining 43,000 are distributed among the electric specialty manufactories numbering about 225 in 1904. The total capital invested in the electric industry is estimated at 30,000,000%.

REGENT HOTEL, ROYAL LEAMINGTON SPA.

THE beautiful town of Leamington has a world-wide reputation for its Spa, and is well known as the most convenient centre for the many beautiful and interesting spots of Warwickshire—Kenilworth and Warwick Castles, Stoneleigh Abbey, Guy's Cliff, &c. A fresh addition has been made to the attractions of the town by the entire remodeling, redecoration and refurnishing and bringing up to date with every modern convenience and luxury of this fine *hôtel de luxe*, of which a short description will be found interesting.

Passing through the spacious hotel entrance and vestibule decorated with faience, it will be found that the accommodation has been immensely improved. On the ground floor is a handsome lounge, a large drawing-room decorated and furnished in Louis XV. period, a grand Georgian dining salon and ball-room overlooking the gardens, fitted with polished oak dancing floor supported on spiral springs, specially constructed on the latest and most approved principles; a commodious smoking-room, billiard-room, &c. A public telephone for the use of visitors is also provided. At the south-east angle a spacious restaurant and buffet are arranged with decorated tile wall-linings and mosaic floors, and beyond a lofty public billiard-room fitted

ROBERT W. BLACKWELL & CO., LTD., 59 CITY ROAD, LONDON.

with two tables. At the back, and connecting the dining salon and restaurant, the model kitchen and offices and service are arranged, with specially constructed cold storage accommodation worked by an electric motor, special care having been taken in planning so as to facilitate quick service.

From the ground floor access is gained by the grand oak staircase or electric passenger-lift to the three floors above, which contain spacious and luxuriously furnished sitting-rooms and bedrooms for 120 or more guests, a portion being arranged *en suite* to suit the convenience of guests. Each room is fitted with electric light, a telephone in direct communication with the several services, and special accommodation is provided for visitors' servants. Every floor is provided with tile and mosaic-lined lavatory and bath-room accommodation fitted with special showers and every convenience, and, needless to say, the whole of the sanitary and warming arrangements have been carried out in the most up to date manner.

Attached to the hotel and in direct communication at ground and first-floor levels a steam laundry has been arranged and fitted with the latest approved machinery. At the back of the hotel grounds and approached through a large archway adjacent to the south wing access is gained to the stables and coach-houses providing accommodation for ninety horses, conveniently divided up into stalls and loose boxes for hunters, also a motor garage fitted with pit and repairing-shop, for the whole of which a contract has been entered into for entirely refitting and retraining in a manner that will correspond with the way in which the hotel has been treated.

The builder is Mr. R. Cleaver, of Northampton, and Mr. C. Ridley Shield has acted as clerk of works. Messrs. Flavel, of Leamington, have fitted the kitchen and offices; Messrs. Braithwaite, of Kendal, the laundry. Messrs. Brown & Parsons, of Leamington, have executed the whole of the electric lighting, the Eastern Lift Company the passenger and service lifts, and the Art Pavements and Decorations, Ltd., all faience, tile wall-lining and mosaic work. Messrs. Shanks, of London, have supplied all sanitary fittings. The architect is Mr. Ernest R. Barrow, A.R.I.B.A., of the firm of Messrs. Brown & Barrow, of 12 Norfolk Street, London, W.C.

The hotel is the property of Mr. J. J. Cridlan, and the whole establishment is to be run at moderate charges, giving the best possible French and English *cuisine* and accommodation, and is especially convenient for invalids, being in close proximity to the Pump-room baths and public gardens, also for American visitors wishing to see Shakespeare's country, and being in the midst of a famous hunting district will serve, in conjunction with the stables, as a splendid rendezvous for huntsmen. A four-in-hand coach leaves the hotel daily for Stratford-on-Avon and district. There is a splendid new service of express trains from London in one hour and fifty minutes by Great Western and London and North-Western Railways, and excellent communication with the North and all parts.

THE JAPANESE TIMBER TRADE.

THE report of the Yokohama Chamber of Commerce for March states that the Japanese Department of Agriculture and Commerce intend to export timber from the State forests to North China and Korea, through contract exporters. According to Imperial Ordinance No. 32, just issued, contracts for exporting the State timber will only be concluded with those merchants whose annual business tax is not less than 250 yen, or with those companies which have a paid-up capital of not less than 50,000, or those merchants abroad who are testified by the Japanese Consul as possessing property worth 50,000 yen or upwards. This business enterprise is believed to be a promising one. Hitherto North China and Korea have obtained their timber supplies mainly from the banks of the Yalu. But this source of supply was stopped for military reasons, and the timber now brought to the market from South China and America is quite different from that to be exported from Japan, so that competition is out of the question. In Japan the demand for timber is amply supplied from private forests, and a large surplus remains for export. In view of these circumstances, the Diet recently voted 380,000 yen as expenditure for carrying on this business. According to the authorities, the forests first to be felled for exportation purposes will be those in Aomori and Akita prefectures and Kishu, Tosa and Shinshu provinces.

IRON TRADE OF GERMANY.

ACCORDING to the report of Consul-General Schwabach, the concentration movement in the German iron industry which has attracted so much attention may be classed under two headings. On the one hand there is a tendency to concentrate different branches of the industry, representing generally consecutive stages of production, while on the other the object seems to be the regulation of the output and prices, the home and lately also the export market by cartels or syndicates comprising single branches of the industry (such as the powerful Pig-iron Syndicates) or a number of branches (such as the Steel Works Syndicate). The latter developments, which aim at a complete organisation of a whole national industry, was referred to in previous reports; the tendency to concentrate different stages of production in one works has also been dwelt upon, but more comprehensive information may be appreciated. An able exponent of this process characterises it as follows:—"The ideal concentration, which has already been achieved in a number of cases, consists in the uninterrupted concentration in one hand of all the stages of production required to produce a 'Fertigfabrikat' (finished article) from the mining of ore and coal, the smelting of pig-iron and its conversion into steel up to the manufacture of the finished article." The advantage offered thereby in respect of a considerable saving in the coal and coke bill and cost of transport, general cost of production, the possibilities for the most economic division and combination of labour will, of course, vary according to local conditions, such as the proximity or remoteness of ore and coal supplies from the ironworks or the latter from the steelworks, &c. The technical advantage of a concentration is apparent, but the economic considerations play the most important part; the wish of the steel and other works to become independent as regards the supply of raw materials and partly finished goods was met half-way by the desire of coal mines and ironworks to escape the restrictions placed on their production by the Coal Syndicate and the Pig-iron Syndicate, for the quantities of coal and pig-iron used in the ironworks is not included in the quota for sale to third parties. This practice, if generally adopted, must logically undermine the

syndicates, as it is equivalent to an evasion and thwarting of their very efforts and principal aim to regulate the production, and the Coal Syndicate at least is already forced to consider means of dealing with the difficulties arising from the privilege accorded to "Hüttenzechen," i.e. coal mines combined with and owned by ironworks to produce the coal required by these over and above their selling quota. The syndicate and cartel movement and the concentration movement are therefore likely to clash. The concentration tendency has made considerable progress this year, and the position is peculiar in so far as the very men who have promoted these concentrations are among the most influential members of the Coal Syndicate. From 1893 to 1902 the number of "Hüttenzechen" increased from 7 to 18, and their output from 4,000,000 to 11,000,000 tons.

The amalgamations between collieries and iron and steelworks include the Gelsenkirchen-Rothe Erde-Schalcke Combine, and it is noticeable that in this case the Gelsenkirchen Colliery is the most important factor of the combine. In 1903, 4,962 works in the iron industry were "combined works," 138 of which were combined with 5, 112 with 6, 80 with 7, 27 with 8, 10 with 9, 12 with 10, 23 with 11, 26 with 12, that is to say, 428 were combined with 5 and upwards of 5 works. Of 88 blast furnace works 50 were connected with other branches in 1903. These were connected with ingot and ironworks in 34 cases, welded ironworks in 18, cast steelworks in 17, rail, girder, &c., works in 26, bar ironworks in 29, plateworks in 20, foundries in 32; making a total of 176 cases. The 96 ingot ironworks were connected with other works, viz. with blast furnace works in 34 cases, welded ironworks in 34, cast steelworks in 29, bar ironworks in 55, rolling mills manufacturing rails and girders in 39, plate mills in 39, rolling mills for pipes or tubes in 13, wire rolling mills in 16, wire drawing mills in 7, fine iron industries in 17, engineering works in 14, boilerworks in 14; making a total of 311 cases. The whole of the 50 rolling mills, manufacturing rails and girders, were connected with other branches, viz. 39 with bar ironworks, 17 with plate mills, 11 with wire-drawing mills, 9 with tubeworks; making a total of 76. Of 107 bar ironworks only 6 were not combined with other branches, of 92 plate mills only 10, and of 195 wire-drawing mills, 92. All of the wire-rolling mills were combined works.

ALEXANDRA HOSPITAL, PORTSDOWN.

WITH business-like acumen of a sort that is not usually credited to them, says the *Portsmouth Evening News*, the War Office authorities are erecting a fine modern hospital on a splendidly situated thirty-acre site on the southern slope of Portsdown Hill without asking the taxpayer for a penny piece to pay for it. This manœuvre has been achieved by selling the antiquated hospital—it is nearly 100 years old—in Lion Terrace, Portsea, to the Admiralty for 80,000*l.* and applying the sum obtained for this valuable urban site to building a thoroughly up-to-date institution on an infinitely healthier but vastly cheaper position on the breezy side of Portsdown. It is believed, even, that there will be a nice little nest-egg in hand out of the 80,000*l.* to be carried forward for other Army purposes.

The hospital buildings are for sanitary reasons much detached, and are dotted all over the estate obtained from the Lord of the Manor, but the non-contagious disease cases will be placed in a diffuse two-storey building somewhat resembling the letter E in shape, but with four horizontal lines. The backpiece of the E is represented by a corridor 430 feet long—twice as long as the town hall is high—running on each floor from end to end of the buildings and from east to west. From it jut out down the hill the four pavilions of eight big wards, each to contain twenty-two beds. The run of them is north and south, and thereby, except at midday—when the intense heat is undesirable in summer-time—the sun pours in from morn till eve through the lofty windows between the beds. As is the case now with all the best hospitals, the offices and bath-rooms are really separate from the wards, being built at the end and approachable only through the open air. In addition to the wards used in common, there are distributed at the entrance to the pavilions four small single-bed observation wards, four wards for lunatics, a ward for four eye cases, and a four-bed ward each for prisoners and for soldiers suffering from that dread complaint commonly known as the itch. Thus in the main building we have a total accommodation for 197 cases of all sorts, which can be distributed into any of twenty-two wards. The lavatory and office accommodation is in all cases excellent, and

splendid arrangements have been made for dealing with dirty linen in a sanitary manner.

The operating theatre is placed, as in the best hospitals, on the north side of the building, to avoid the variations in shade caused by the entry of the sun's direct rays, and there is a lantern in the roof directly above the operating table. Other rooms for special purposes include an anæsthetic room, a sterilising room and a Röntgen-ray room, to be used both for photographic purposes and for the cure of lupus and the alleviation of cancer by exposure to the X-rays.

Symmetrically placed in the centre of the buildings is the administration block. Externally it is somewhat ornate, the terra-cotta facings being more in evidence here than in the rest of the hospital, where Rowland's Castle or Fareham red brick predominates. Here, on the ground floor, are the men's and women's waiting-rooms, the dispensary, laboratory, matron's office, big kitchen (30 feet square), scullery, &c. All the cooking will be done by gas, and hand lifts are everywhere used for the conveyance of the food to the patients. A passenger lift gives access to the first floor, where are the various medical officers' rooms, clerk's room and a dining hall and recreation-room for convalescent patients. Manchester stoves, open grates and coils are used for heating, and in the pneumonia ward special fittings are to be supplied to give a regular temperature. Two big Cornish boilers are to be erected in the basement for warming the coils. Along the corridors there are numbers of store-rooms, lifts for coal, &c., and private rooms for the female nursing staff; and it may be added that the building is so placed that when needed it can be extended on the present plan to almost double its existing accommodation by the addition of three more pavilions. The floors of all the wards are fireproof, being built of concrete and iron girders, and the flooring-boards are tongued and grooved to secure a close joint with no nails showing, while all corners are rounded. Where these are not used the ordinary floors are of maple.

The infectious diseases blocks are a quarter of a mile away from the big buildings, and on the lee side of the usual breeze in these parts—a south-wester. There are three for the women and children and three for the men, to allow of a suitable selection of the cases to prevent

contagion, and each set has ten beds available without pressure on the accommodation. Close by is the special mortuary, with an entrance direct into Southwick Road, and in a disinfecting block is a special steam plant to kill germs in the big articles like mattresses. The infected articles go in one side, are steamed for fifteen minutes and come out the other side sterilised.

The principal medical officer has a fairly commodious, but not luxurious, house, provided for him in the lower part of the grounds, with a two-stall stable adjoining. A little further up the hill on the far side are the R.A.M.C. officers' quarters. Here four single officers can be accommodated, each having a partitioned bed-sitting-room, while the messman also sleeps on the premises. Further round still is the officers' mess, and next comes the barrack block, where in four dormitories fifty-six privates of the R.A.M.C. can live and sleep, the sergeant having a room to himself. Close at hand are special bath-rooms for them, stores, kitchen, &c.

Other groups of buildings include a coalyard to store 150 tons of coal, married quarters neatly arranged for fourteen families, a laundry for the common use of these families, with an ironing-room and drying-chamber all complete; a well-appointed sergeants' mess, a men's recreation-room with a stage ready and waiting for artistes, a wet and dry canteen with a bottle-and-jug department for the women folk, a general mortuary, and a porter's lodge at the gate.

The works have now been in hand two years, and it is hoped to finish them by the middle of next summer. Much has to be done meanwhile, as most of the roofs are not yet on and the floors have still to be made and laid, the big wards, 80 feet by 24 feet, being mere shells. Roads are being constructed out of the flints from the excellent chalk foundations.

The hospital being so far from the garrison, a small emergency ward is to be built in the corner of the men's recreation ground and the grammar school. An electric ambulance car running from a specially constructed siding in the men's ground will carry the patients over the Corporation lines to Cosham, and from the light railway a second siding will lead up to the back of the hospital. The method of lighting the buildings has not yet been decided on, but it may be by electricity from the Corporation mains.

No less than four miles of drain pipes have been laid, as there is both a storm-water and a foul-sewage system.

The architect is Mr. H. B. Measures, F.R.I.B.A., director of barrack construction, who designed the Rowton lodging-houses; Messrs. Kirk & Randall, of Woolwich, are the contractors, and Mr. J. H. Sills is clerk of the works.

RATING OF CLAYWORKING PROPERTIES.

In an article on the above subject in the *British Clayworker* Mr. J. Jopling writes:—Clay, brick-earth, sand, &c., are the clayworker's raw materials pure and simple; he manufactures certain goods from them, and sells those goods. He however, rated on the value of his land, buildings, works and raw material. The cotton spinner is rated on the rental value of his land and mills, but not on his raw material. A manufacturer of wood goods is rated on the rental value of his land and works, not on the wood he uses, which is his raw material. The occupier of a saw mill, established on an estate to use up and consume the growing timber thereon, is rated on the rental value of the saw mills, not on the value of the timber that is his raw material. The foregoing sufficiently show that the clayworker is in a peculiar position. What is really needed is a strong and representative body or association to urge these things upon the powers that be, and to assist its members in resisting any claim that is really unfair. The writer suggests that the following should be the general lines of rating procedure:—Royalty being, as a matter of fact, the purchase price of a certain raw material (and in no sense a rent), should be exempt from rating. The one great principle, viz. that the assessable value of a property is its fair rental value, less the statutory deduction, should be strictly adhered to. Whenever the rating authority alters an assessment, notice should be given to the person concerned, and the reason for the alteration stated. If the ratepayer feels aggrieved, he should within a given time signify his intention to object or appeal. The appeal should be heard and adjudicated upon by an independent, disinterested person, having practical knowledge of the particular class of property as to which the dispute has arisen.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of MESSRS. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BEXHILL.—July 27.—Designs for a public elementary school at Bexhill-on-Sea, Sussex. Premiums of 50l., 30l. and 20l. are offered. Mr. A. H. Ryan-Tenison will act as assessor. Secretary of the Education Committee, Amherst Road, Bexhill.

CARLISLE.—Aug. 1.—Designs and estimates for the erection of school buildings, caretaker's cottage, &c., on a site off Greystone Road. Architects must be practising exclusively in Carlisle, or resident therein, or whose head office has been located there since May 1904. Mr. A. H. Collingwood, clerk, 15 Fisher Street, Carlisle.

HOVE.—Aug. 1.—Designs for new free library, not to exceed 10,000l. (exclusive of furniture). Premiums of 50l., 30l. and 20l. Further particulars, Mr. H. Endacott, town clerk, Town Hall, Hove.

PERTH.—Aug. 1.—Plans for (1) reconstruction of the existing city hall at a cost not exceeding 6,000l., and (2) erection of a new hall at a cost not exceeding 15,000l. Premiums will be awarded authors of plans placed first, second and third in order of merit as follows:—(1) For reconstruction, 30, 20 and 10 guineas respectively; (2) for a new hall, 50, 30 and 20 guineas respectively. Instructions, general conditions and plan of site from Mr. John Begg, town clerk.

CONTRACTS OPEN.

ABINGDON.—June 24.—For the erection of a new ward block (sixteen beds). Mr. J. G. T. West, architect, The Knowl, Abingdon.

ASHBY WOULDs.—July 1.—For the construction of sedimentation tanks, detritus chamber, percolating filter and about 1,700 lineal yards of 8-inch stoneware-pipe sewers, with manholes, &c. Messrs. Herbert Walker & Son, engineers, Albion Chambers, Nottingham.

ASHREIGNEY.—June 28.—For a new Bible Christian chapel and schoolroom at Ashreigney, Devon. Mr. Robert Alford, Riddlecombe, Ashreigney.

BARNET.—June 29.—For the erection of a church house at Barnet. Mr. J. C. Traylen, architect, 16 Broad Street, Stamford.

IMPROVED" PATENT
CALORIFIER.

BILLERICAY.—June 24.—For the construction of pumping-stations, sewers and filtration-beds in the district of Shenfield, near Brentwood, Essex. Messrs. Jones, engineers, Parliament Mansions, Victoria Street, Westminster.

BILLERICAY.—June 26.—For additions and alterations to the isolation hospital, Gooseberry Green, near Billericay, Essex. Mr. R. J. W. Layland, Billericay.

BRISTOL.—July 1.—For the erection of four workmen's dwellings at the junction of Fishponds Road and Freeland Buildings, Bristol. Mr. T. H. Yabbicom, city engineer, 63 Queen Square, Bristol.

BROMLEY.—June 27.—For proposed works to the operating-room at the district sick asylum, Devon's Road, Bromley, E. Messrs. J. & W. Clarkson, architects, 136 High Street, Poplar, E.

BROMPTON.—July 3.—For the whole or any of the various trades—namely, bricklayer and mason, carpenter and joiner, plumber and glazier, slater, painter and ironfounder's work—required in extension of spinning mills at Brompton, near Northallerton. Messrs. Thos. Winn & Sons, architects, 92 Albion Street, Leeds.

BURNHAM.—July 3.—For the erection of a new room and offices at the school. Rev. F. F. Penruddock, Burnham Vicarage, Bucks.

BURTON-UPON-TRENT.—June 30.—For the construction of permanent way, including paving of a route length of 1½ miles of tramways, together with works in connection with the road widening and alteration of levels. Messrs. Kincaid, Waller, Manville & Dawson, consulting engineers, 29 Great George Street, Westminster.

CHESHUNT.—June 26.—For the erection and completion of a new petty sessional court and technical school, Cheshunt, Hertfordshire. Mr. Urban A. Smith, county surveyor, Hatfield.

CHESTER.—June 24.—For the erection of shedding, canyas and other works in connection with the annual exhibition, August 30. Mr. T. A. Beckett, secretary, St. Werburgh Chambers, Chester.

DARLINGTON.—June 26.—For taking-out the decayed stone in the town hall, clock tower and market buildings, and inserting about 1,300 cubic feet of new stone. Mr. George Winter, borough surveyor.

DEVONPORT.—June 28.—For repairs and painting at the isolation hospital, Bladderly. Mr. John F. Burns, borough surveyor, Municipal Offices, Devonport.

DORCHESTER.—June 24.—For repairing and painting, &c., at the headquarters police-station, Dorchester, where specifications may be seen.

DURHAM.—June 27.—For the erection of new brick latrines at Greencroft school. The Education Office, Durham.

ECCLES.—July 5.—For the erection of forty-six semi-detached houses in and off Lewis Street, Patricroft, Lanes. Mr. George Meek, architect, Leinster Chambers, 4 St. Ann's Square, Manchester.

EDINBURGH.—June 28.—For the mason, carpenter and joiner, plumber, plasterer and slater's work to be executed in setting back frontage of properties at corner of Salisbury Place and Minto Street. Burgh Engineer, City Chambers, Edinburgh.

FELTHAM.—July 17.—For alterations at the town hall, Feltham, Middlesex. Mr. H. T. Wakeham, county architect, Middlesex Guildhall, Westminster.

GLASGOW.—June 24.—For the digger, concrete and brickwork of the foundations and substructure of the new north block of the Glasgow Royal Infirmary. Mr. James Miller, architect, 15 Blythwood Square, Glasgow.

GLASGOW.—July 1.—For (1) the digger, brick and mason, &c., work, and (2) the sanitary fittings required in connection with the extension and alteration of the public convenience at Gorbals Cross. The Office of Public Works, City Chambers, 64 Cochrane Street.

GLASGOW.—July 3.—For the erection of a sub-station in Stirling Road, Glasgow. Mr. W. W. Lackie, engineer, 75 Waterloo Street, Glasgow.

GUILDFORD.—June 27.—(a) For the erection of brick and concrete piers to carry a girder bridge across the river Wey at Newark, (b) for the supply of the iron and steelwork and fixing of same in connection therewith. The Engineer, District Council Offices, Commercial Road, Guildford.

HOLBETON.—June 30.—For the erection of a dwelling-house on Alston estate, Holbeton, near Plymouth. Mr. Geo. B. Perrott, architect, Kingsbridge.

NEW CATALOGUE.

IN no class of industry has machinery been more successful than in laundry work. At one time it was monopolised by a very humble class of people, and it was well known that bundles of clothes had to periodically find their way to pawnbrokers owing to the difficulty of finding money to pay for assistance. Now, laundry work is taken up by limited liability companies, and, if well managed, they are found to be profitable enterprises. It is not necessary to say anything about the risks of contagion which not so many years ago were a danger to the public. Owing to buildings which are properly designed and to machinery all the processes can now be conducted with safety. The extent to which machinery is applied can be judged from the illustrated pages of the new catalogue of Messrs. W. Summerscales & Sons, Ltd. Established in 1850, the public owe much to them for the improvements which they have been able to effect in laundry work by their machines. Their ingenuity has produced excellent results, and with such a guide as the catalogue affords it would not be difficult to meet the requirements which are now essential. They have special sanitary apparatus such as a hot-air fumigator, steam disinfectors, &c. With so many arrangements for employing heat it is a short step with Messrs. Summerscales from the laundry to the kitchen. They produce many aids to cooking on a large scale which are adapted to public institutions, clubs and hospitals, as well as improved kitchen ranges which are adapted for ordinary houses. The catalogue is worthy of preservation.

THE Homeland Association have published two additional handbooks, which are well adapted for those who wish to spend their holidays in an English district. One relates to the neighbourhood of Huntingdon, the Great Ouse, St. Neots and St. Ives; the other to Horsham and St. Leonard's Forest. The two districts are unlike, but both are interesting, and offer many objects which are worth the attention of tourists. They are carefully written from personal observation, and are therefore superior to guide-books which are only compilations.

THE special committee of the London Corporation to whom, in conjunction with the Bridge House estates committee and the streets committee, was referred the consideration of the question of widening Blackfriars Bridge with a view to the linking up of the tramways, have come to a decision in favour of the proposal, leaving the details as to the cost and method of widening and the conditions under which tramways should be admitted into the City for further discussion.

TRADE NOTES.

A LARGE clock with three dials has just been erected in the parish church at Elsecar, Yorkshire, by John Smith & Sons, Midland Clock Works, Derby. It is generally to the designs of the late Lord Grimthorpe.

MESSRS. ARTHUR L. GIBSON & Co. have received the contract for ten Kinnear rolling shutters with patent trolley wire connections for the car shed at Swadlincote of the Burton and Ashby Light Railway.

THE Coalbrookdale Co., Ltd., give notice of their removal from Queen Victoria Street to Rathbone House, 15 and 16 Rathbone Place, Oxford Street, W. The new premises are large and admirably lighted, thereby offering adequate opportunity for exhibiting the numerous goods of the company. The Tottenham Court Road station of the Central London Railway is within about three minutes' walk.

MESSRS. W. POTTS & Son have just completed a new Cambridge-quarter clock for the Huddersfield Co-operative Society, with three illuminated dials 6 feet 6 inches in diameter, and a set of bells from Lord Grimthorpe's design; and also a new hour striking clock showing the time upon three external dials painted and gilt at Warley Church, near Halifax.

NEW COMPANIES.

THE prospectus has been issued of Messrs. F. Smith & Co., Ltd., Carpenters' Road, Stratford, London, E. The company is formed for the purpose of acquiring and taking over as a going concern the business of Messrs. F. Smith & Co., iron buildings and roofing manufacturers. Their business has increased so rapidly that further capital is needed for an extension of the works in order to keep pace with the orders placed with them. The use of iron buildings is becoming more and more general. It is estimated that the British Government alone have expended in this way between 2,000,000*l.* and 3,000,000*l.* during the past three years. The capital of the company is 12,000*l.*, and is divided into 5,000 Seven per Cent Cumulative Preference shares and 7,000 Ordinary shares of 1*l.* each. The present partners will take a large portion of the purchase money in Ordinary shares. The great success of the business cannot be questioned when we are told that during the past four years the profits show an average return of about 80 per cent. per annum on the capital employed. The subscription list opens on Monday next, the 26th inst., and closes on the following Friday, June 30.

MESSRS. JOHNSON & PHILLIPS have been in business since 1875 as electrical, telegraph and general engineers. The premises at Old Charlton, Kent, were originally one-eighth of an acre in extent. It is indicative of the excellence of the manufactures to find that each year has seen an addition until in 1905 they occupy about 8 acres. The object of the formation of this company is to allow Mr. W. C. Johnson, the sole proprietor since 1893, to retire. This will not affect the fortunes of the new concern, as the business will continue to be in the hands of the same general and departmental managers who have almost entirely controlled it during the last five years. Messrs. Kennedy & Fox, chartered accountants, certify that the profits of Messrs. Johnson & Phillips during the five and a half years ending December 31, 1904, have averaged 37,664*l.* per annum. The capital of the company is 175,000*l.* divided into 175,000 Ordinary shares of 1*l.* each. The subscription list opened on Thursday, June 22, and will be closed on the 23rd for town and the 24th for country.

VARIETIES.

THE late Baron Nathaniel de Rothschild has bequeathed about 835,000l. for the building and endowment of a sanatorium.

THE Metropolitan Life Insurance Company are to enlarge their New York offices by a tower 70 feet square and 560 feet high.

THE site of a small cigar shop at the corner of Wall Street, New York, has been sold for 140,000l. This works out at more than 16s. the square inch and 5,200,000l. an acre.

THE Foleshill Board of Guardians have received the sanction of the Local Government Board to a loan of 9,250l. for the purposes of providing an infectious diseases hospital. It was decided to apply to the Public Works Loan Commissioners for the loan.

THE Board of Trade are in receipt, through the Foreign Office, of information from His Majesty's ambassador at Washington to the effect that goods for use in the construction of the Panama Canal coming from countries other than the United States are free of duty.

THE Widnes municipal gasworks produced last year a profit of 6,135l., though the gas is the cheapest in the world—1s. 6d. per thousand feet to private consumers and 1s. 2d. to manufacturers. Production and distribution cost 11d. per thousand feet, and last year the residuals more than paid for the coal used.

SINCE the commencement of the construction of the new dock at Avonmouth, Bristol, there have been eight fatal accidents, and an inquest was held on Saturday. The deceased fell a distance of 13 feet into a trench, which he was crossing by means of a truss-beam. He struck his head against a stone block, and died shortly afterwards from fracture of the skull. The verdict was "Accidental death."

THE Nobel's Explosive Company, Ltd., Glasgow, despatched on the 17th inst. a special representative to Tokio to superintend the erection of a large factory in Japan for the manufacture of war explosives. The factory will take two years to erect and equip, and it is stipulated that the Japanese Government is to have the option of acquiring the new factory after ten years.

THE Anstruther harbour commission have asked the Board of Trade for approval of a scheme of harbour extension to cost 36,000l. The harbour is the centre of the fishing industry, and it could be greatly developed if further harbour facilities were available. The locality find it impossible to raise the 24,000l. of the total cost. It is hoped that a free grant to carry out the improvement will be obtained.

THE Local Government Board has refused to allow the Brighton Corporation to borrow 4,000l. in order to pay the cost of laying down a track for the motor speed trials to be held by the Automobile Club in July. It is contended that the road was in no need of any repair. The cost of the work, which is nearly completed, will now have to be borne by the ratepayers.

THE renovation of the roof of Cannon Street railway station, which has just been completed, occupied sixty men for sixteen months and cost 12,210l. The materials used included 12½ tons of paint, 195 tons of ironwork, 21,000 square feet of zinc, 20,500 slates, 38,000 square feet of glass, 865 gallons of oil, 45 tons of putty, 1½ tons of nails and 3,300 gallons of petroleum.

THE directors of the London and North-Western Railway Company have accepted the tender of Messrs. Holme & King, Ltd., railway and public works contractors, Liverpool, amounting to about 400,000l., for the construction of a new dock at Garston, covering an area of some 16 acres. The work consists in the removal of about 1,500,000 cubic yards of excavation, and is mostly in red sandstone rock, which has to be conveyed along the main line of railway and tipped upon land at Ditton Junction, so as to form extensive goods sidings there. The sea walls are of a heavy type, and consist of cement concrete to the extent of upwards of 100,000 cubic yards.

THE Southwark Borough Council recently served a notice on the trustee of an estate in Walworth requiring one of the rooms to be stripped and cleansed because the sanitary inspector considered that the walls showed signs of being verminous. The requirement to strip the walls was disregarded, and the new paper was put on over the old. The case was brought to the Lambeth police court on

"MAXIMUM LIGHT GLASS."

THE ONLY DAYLIGHT INCREASING WINDOW GLASS
COMBINING LENSES AND PRISMS.

NO DARK BUILDINGS, rooms, or basements where this glass is used.

GIVES 5 to 40% MORE LIGHT than any flat-back prismatic glass on the market.

ORNAMENTAL IN APPEARANCE inside and out.

STRENGTH immeasurably increased. Does not crack like ordinary prismatic glass.

DIFFUSION OF LIGHT is complete.

ALL SHADOWS ELIMINATED.

MAXIMUM LIGHT GLASS . . .

Is supplied in sheets for glazing like ordinary window glass.

Also in ornamental patterns glazed in lead.

And in crystal tiles framed in copper.

Imperial Buildings, Ludgate Circus, E.C.

the 16th inst. For the defence it was contended that the walls were not verminous, and that as there was, therefore, no nuisance, the Council had no power to issue the order. Evidence was also called to show that it was not customary to strip walls, except for special reasons, unless there were more than two papers upon them. The magistrate said that, without laying down a hard and fast general rule, in this case the walls ought to be stripped, and made a order accordingly. It was intimated that probably there would be an appeal.

A DEPUTATION on behalf of the unemployed in Birmingham waited on Monday upon the Lord Mayor, as chairman of the tramways committee, in reference to the importation, as they allege, of outside labour on the tramway contracts. It was stated that a large proportion of the men engaged on the Nechells tramway route were strangers to Birmingham. A meeting of unemployed had been recently attended by 1,000, and of that number 400 had some knowledge of tramway work. Many of these men had been refused employment. In reply to the deputation his lordship again pointed out that the tramways committee could not dictate to the contractors. He promised to bring the complaint before the members of the committee and the contractors, and that investigations should be made so as to determine the exact state of affairs concerning the employment of local and "imported" labour.

ELECTRIC NOTES.

MR. FRANK BAILEY, the engineer of the City of London Electric Lighting Co., Ltd., states that if the accounts of the borough councils supplying electricity were accurately audited, there is no doubt that they would show a loss.

At a meeting of Kirkcaldy Town Council on the 19th inst., the report by Mr. O. F. Francis, burgh electric engineer, was submitted, showing deficits of 403% on electric lighting and 1,500% fully on tramways.

The exports of electrical plant and material from the United States show an increase, the figures for the ten months ended April last being 9,915,100 dols., as against 8,722,957 dols. for the same period of the preceding year.

The best customers in order of value are British North America, Japan, the United Kingdom and Mexico.

DURING the thunderstorm which passed over the Manchester district on Monday afternoon an electric tramcar going along Oldham Road, Waterloo, near Ashton, was struck by lightning and set on fire. The flames were soon extinguished with water, but the tramcar was unable to continue its journey.

THE contract for the extensive electric works proposed at the head of Loch Leven, Glencoe, by the British Aluminium Company has been given to Sir John Jackson, Ltd. The undertaking, which includes the utilisation of local water-power for the production of electricity for industrial purposes, is to proceed on a very extensive scale, the cost running into six figures.

THE Welshpool ratepayers have passed a resolution in favour of the introduction of electric light. The town's refuse is, it is said, sufficient to find work for a destructor, which would give power for lighting 1,500 eight candle-power lamps. In addition a landowner has offered to let the Council have the turbines by the river at a low rent on a long lease, which would enable them to produce current as cheaply as a farthing per unit from water-power.

MR. JAMES DALRYMPLE, the Glasgow tramway manager, who was invited to Chicago to advise Mayor Dunne on the municipalisation of the local lines, has declared his conviction that in America municipal ownership could not be completely successful because political considerations dominate the situation without regard to the real needs of the community. The only specific for the disease was the full use of a Civil Service system.

MESSRS. GRIFFITHS & Co., the contractors for the Lincoln electric trams, are to commence the work of construction without delay. The contractors must finish within twenty weeks of the commencement, but they calculate that they will not occupy more than seven or eight weeks in accomplishing the work. The line will be double, and the roadway under the railway bridge near Boultham Avenue will have to be lowered to admit the passage of the "double-decker" cars.

THE result of the year's working of the Southport Corporation's electricity department has been a net profit

147 STRAND, LONDON, W.C. (FIRST FLOOR.)

of 3,355*l*. From the total revenue of 22,593*l* there was a gross profit of 14,771*l*. Interest and sinking fund absorbed 11,415*l*. The amount now paid in reduction of debt amounts to 32,878*l*. The surplus has been dealt with as follows:—In aid of rates, 2,500*l*; rates suspense account, 284*l*; and balance and profit and loss account, 570*l*. For the next financial year 2,500*l* has been promised in aid of the rates. The gross profit of the Corporation gasworks amounted to 23,989*l*, an increase of 1,651*l*, while the net profits were 11,473*l*, an increase of 1,473*l*.

THE arrangements for the electrification on a new system of the London, Brighton and South Coast Railway from Victoria to London Bridge, *via* Battersea Park, Brixton and Peckham Rye, are making satisfactory progress. In this case the electric conductors will be overhead instead of being on a three-rail system, and continuous current will not be used. The overhead conductor will be so constructed and supported that even in the event of any breakage it will not be possible for it to descend more than a few inches, and it will then still be outside the loading gauge.

THE Clyde Valley Electrical Power Company's new generating station at Yoker, which has been erected and equipped by the British Westinghouse Electric and Manufacturing Company, Ltd., was opened on Wednesday. A similar station has been erected at Motherwell by the same contractors, as well as various sub-stations dotted over the company's area, which comprises about 750 square miles. The chimney is built on the Alphonse Custodis system, and is 225 feet high above the foundations, with an internal diameter at the top and bottom of 11 feet and 14 feet respectively.

THE annual report by Kirkcaldy burgh electrical engineer on the electric-lighting and tramway schemes shows that on the electric lighting there is a net deficiency of 403*l*. 16*s*. after paying all interest on the sinking fund charges, and to this must be added a debit balance last year of 42*l*. 10*s*. 2*d*. The net revenue from private lighting was not increasing so fast as anticipated, the increase only amounting to 388*l*. 6*s*. 1*d*. for last year. This was due to the small number of consumers. It was proposed to lay before the committee a suggestion to have an electric household apparatus exhibition to advertise the undertaking.

THE Simplex Steel Conduit Company, for their own protection, and with the object of removing an obsolete patent which caused some uncertainty in the electrical trade in reference to patents connected with the continuity methods for socket joint conduits, obtained the authority of His Majesty's Attorney-General to present a petition to the High Court of Justice for the revocation of the said patent on June 3 in the Chancery Division of the High Court of Justice, before Mr. Justice Joyce. The Metallic Seamless Tube Company, Ltd., who had alleged there was an infringement of their patent, submitted to an order for the revocation of the above patent, and judgment was entered accordingly in favour of the Simplex Steel Conduit Company, with costs.

THE electricity committee of Glasgow Corporation have received numerous representations regarding the charges for current. The accounts for the year just closed have yet to be made up, but they are confident that they will be able to reduce the charges for current to shops, warehouses, &c., for lighting purposes from 6*d*. per unit for 365 hours per year maximum demand and 1*d*. thereafter to 3½*d*. per unit for the first two hours' use maximum demand. All consumers, therefore, whose consumption is under the average two hours per day will receive a substantial benefit. They also expect to reduce the charges for stair-lighting from 25*s*. per lamp per annum to 15*s*. per lamp per annum.

MR. GRAHAM HARRIS as arbitrator at the Middlesex Guildhall, Westminster, opened on Monday the hearing of a claim made by Messrs. William Griffiths & Co., contractors, against the Middlesex County Council. The claim arose in connection with the construction of the Middlesex Light Railways system. Messrs. Griffiths contracted to lay the track in Tottenham, and estimated that they would complete the work in twenty weeks. Actually the work occupied fifty-five weeks, and Messrs. Griffiths claimed to be paid the extra cost involved in watching and lighting, rent of local offices, and other matters on the ground that the delay was due to causes for which the County Council was responsible.

THE Mayor of Bournemouth and other members of the Town Council, who signed a cheque for 750*l*., voted by a majority of the members, authorising a payment to Mr.

F. W. Lacey, borough engineer, for extra remuneration in carrying out the electric tramway scheme, were recently surcharged by the district auditor with that amount. They appealed to the Local Government Board against the surcharge, and have since received a reply stating that "the Board were of opinion that the disallowance and surcharge were lawfully made, and they confirmed the auditor's decision, but in consideration of all the circumstances the Board decided to exercise the equitable jurisdiction conferred upon them by remitting the disallowance and surcharge."

THE memorandum of agreement between the Corporation and the Edinburgh and Queensferry Tramway Company relative to the proposed tramway from Edinburgh to Queensferry was under consideration on Monday. The fifth clause provides that the part of the undertaking within the city shall be executed by the promoters at the sight of and to the satisfaction of the Corporation or their engineer; the promoters are to keep in repair so much of the street as lies within their rails and 18 inches on each side of them, and there is a clause protecting the drains, &c. The ninth clause gives the Corporation power to say what system of electrical traction is to be used, the tenth prohibits the company from erecting their power station within the city or of selling electric power or light within the city boundaries, and the eleventh clause contains powers of purchase by the Corporation of the tramways in whole or in part on specified conditions. There are clauses also dealing with running powers, workmen's cars, &c., and the company are to be bound to carry passengers for three miles beyond the city boundary at 1d. a mile.

BUILDING AND BUILDERS.

THE Govan Dean of Guild Court have granted a warrant to reconstruct Bellahouston academy, and erect a further block facing Clifford Street to the south of the present school. The new seminary will have accommodation for over 1,200 children, and there will be a gymnasium and a swimming pond. The cost of the scheme is 17,000l.

ABOUT 30,000 bricklayers and others engaged in the building trade in Westphalia, says the *Daily Chronicle*

Berlin correspondent, have been dismissed in consequence of no agreement with their employers having been come to regarding an increase of wages which they demanded a fortnight ago. The employers were inclined to grant their demands on condition that the workmen broke up their union organisations. This they declined to do.

THE Queen Victoria Memorial hospital at Cheetham, Manchester, is to be altered in order to provide more accommodation for its inmates and for a large staff of administration. The proposed alterations, as designed by Mr. H. Arnold Turner, architect, of Eccles, will provide accommodation for more nurses and probationers, and will include also the reconstruction of the house surgeon's and the matron's apartments. Another feature of the proposed alterations is the enlarging of the hall and the construction of a new entrance in the Renaissance style.

COLONEL R. BARCLAY SHAW, of the firm of Messrs. W. Shaw & Son, Ltd., Glasgow, who died last week, was one of the foremost Scottish contractors. His father died when he was nineteen, and Mr. Barclay Shaw at once assumed control of the business. His tender was accepted for the erection of the buildings for the Glasgow exhibition of 1888 as also for those of 1901. Under his supervision the extensions at Woodilee asylum were completed at a cost of over 70,000l. Many buildings in the city, including the Fyfe Chambers in West George Street and the City Parish Council Chambers in George Street, were constructed by his firm.

THE annual general meeting of the Association of Master Plumbers was held last week in the Building Trades Exchange, Glasgow. The annual report stated that the membership stood at 180, eleven members having been admitted during the year. The report also dealt with the work done, and, in referring to the stoppage of labour by the operatives connected with the Amalgamated Society on account of the reduction in wages of 3d. per hour, the secretary reported that the position, so far as the masters were concerned, was practically unchanged since the last meeting, the majority of the members finding no difficulty in executing their work. It was also reported that several operatives who had been members of the Amalgamated Society had returned to their work under the new conditions. The funds of the Association as at April 30 last

THE BUILDERS' EXCHANGE AND EXHIBITION.

THE Builders' Exchange and Exhibition in Birmingham is progressing most favourably. The number of exhibitors and catalogues already arranged is 329, and this is being added to daily, so that when the day of opening arrives—June 29—the whole thing will be in good shape. The exhibition is to be opened by the president, Mr. Wm. Sappote, and there will be a large and representative gathering of the combined profession of trades. The Canadian manufacturers will be in the city on June 26, and they are to visit the exhibition. They will be able to see there those trades which truly represent the manufactures of the district. The position of the Exchange is all that could be desired, and the building is both central and well lighted, and most adaptable to all that is likely to be required. There seems little question, indeed, that this new venture in Birmingham is going to be a great success. May it go forward, expand and increase.

THE LATE THOMAS LISTER, C.E.

ON Sunday evening the death took place at his residence, Morton, Gainsborough, of Mr. Thomas Lister, at one time a well-known engineer, particularly in connection with early railway development. According to the *Sheffield Daily Telegraph*, he worked in conjunction with the Stephenson, also with George Hudson, who was known as the "railroad king." Mr. Lister was ninety-six years of age, and his life story is of unusual interest. He was born at Wath, near Doncaster, in 1809, his father being a stonemason. He was apprenticed to a carpenter, but bought himself out of his apprenticeship at eighteen or nineteen, and went to his brother, an architect, at Rotherham. Here he was set to make tracings of plans of bridges in connection with the

construction of the Grand Junction Railway, now the L.N.W.

In 1837 he assisted in the construction of the Sheffield and Rotherham Railway, and turned the first sod half-way between the two towns. Subsequently Mr. Lister prepared an estimate for a line from Blisworth to Oundle for Stephenson, who next employed him on a branch line from Blackburn to Preston. That finished, Mr. Lister was sent in 1841 to superintend the construction of that portion of the then Manchester, Sheffield and Lincolnshire Railway lying between Bole (Notts) and New Holland, on the banks of the Humber. The most important portions of this work were the Kirtley Lindsey tunnel, built on an incline and cut through rock full of springs, and the railway bridge over the river Trent, where "quicksand" difficulties were successfully overcome.

Mr. Lister was then employed by Mr. John Fowler to cut a canal across the island of South Beveland in Holland. He was engineer to the Gainsborough Urban Authority until 1866, when he entered into the shipbuilding business with Mr. Trenery, and in the meantime carried out private works for Sir T. Beckett, Lord Middleton and Lord Hawke (father of the Yorkshire cricket captain). Among other enterprises of a private character were the erection of the Sheepbridge Ironworks in 1857, also the erection of five places of worship in and around Chesterfield.

In 1864 he built for a private company the Gainsborough waterworks, and in 1867 he became architect and surveyor to Messrs. Marshall & Co., of Gainsborough, a position he held until a few years ago. He undertook many other important works during that time.

As might have been expected, Mr. Lister had a rich fund of reminiscences. He was connected with the building of the first "skew" bridge, notable in connection with all Stephenson's contracts, and his experiences of Yorkshire engineering works are particularly interesting. It was in December, 1836, that he was sent into Yorkshire to prepare an estimate for a line of railway from Sheffield to Rotherham for an independent company. Mr. Swanwick was the engineer-in-chief. Stephenson's tender for this line was 66,000*l.*, and the works were commenced on February 28, 1837, at Brightside, where Mr. Lister turned over the first sod. Here the chief feature of the work was a cutting,

and the geological formation was found to be very interesting. In Mr. Lister's own words, "Thousands of fossil ferns were exposed, in perfect figure and profile, as when they were green fronds, and 'now' are 'coal.'" In describing this work, Mr. Lister says in one of his reminiscences:—

"The line passed through the Holmes Works, Masborough, of the late Samuel Walker & Co. He (Mr. Walker) began life as a working foundryman, and died worth 1½ millions. About the year 1813 the Vauxhall Bridge, London, was built at these works by S. Walker & Co. I well remember, as a little boy, walking over this bridge with my father, before it was removed to London. Previous to this a bridge was built here for the East Indies. It was here also that Mr. Isaac Dodds commenced a locomotive engineering establishment, under the management of Mr. John Bell, a North-countryman, who became locomotive engineer and superintendent at Swinton, under the South Yorkshire, now the Manchester, Sheffield and Lincolnshire Railway Company (the Great Central). Near the Holmes Works the line passed through a rock cutting, where a slip occurred—a common occurrence in cuttings which make it necessary to have a watcher to warn the men while at work. In this instance the necessary warning was given, but one man ran under to secure his shovel and was killed."

In another of his reminiscences Mr. Lister says:—

"In 1838, on the occasion of the coronation of Her Majesty Queen Victoria, we had a general holiday." Mr. Stephenson brought out all his stud of eighty horses with their drivers decked with rosettes and ribbons, finishing in the evening with a grand dinner at the Crown inn, Rotherham. At the opening of the Sheffield and Rotherham line a festive gathering of shareholders and friends was assembled at the Tontine hotel, Sheffield, when I heard Mr. George Stephenson make the following statement:—"I congratulate the shareholders of the Sheffield and Rotherham Railway in this undertaking, inasmuch as their line will be the only one that will ever come into Sheffield. Whatever connection Sheffield may have with other places must enter by their line." I also once heard him say on the platform at Chesterfield:—"If Joe Locke ever makes a tunnel through Woodhead I will eat my hat." While the works on the Sheffield and Rotherham line were in progress, Stephenson took

contracts on the Midland, the Greasboro', Masboro' and Wath lines. On the latter (Wath, my native place) was the first locomotive engine for constructive purposes, introduced in consequence of the long distance the earth had to be carried. The Greasboro' and Masboro' contract joined the Sheffield and Rotherham at Masboro' station, and was under the management of Mr. George Mould and Mr. John Stephenson, who at that time resided at Rotherham. The Wath and Darfield was, under Mr. T. R. Stephenson, who resided near Darfield, and was assisted by Mr. J. Stephenson, jun., of Doncaster. The Altofts and Methley, forming two junctions with the Midland near Wakefield, were under the management of Mr. Philip Stephenson, who resided at Glass Houghton. It was at Normanton station soon after the line was opened that the electric telegraph was introduced and adopted by the company. One of the clerks gave up his situation under the impression that the electric scheme 'was infernal, from the dark regions,' and he would not have anything to do with it. I remember on one occasion, when the directors came over these works, Hudson, the railway king, remarked to Stephenson, 'Stephenson, if you don't get better on with your work I shall put you down that embankment.' Stephenson replied, 'Yes, Mr. Hudson, you must take into account that I shall be there when you do so.' Hudson was a draper, residing in York, a great speculator in abortive schemes of railways, and when the bubbles burst he had to refund some quarter of a million, became a poor man, and, I think, went into Spain to Mr. Mould to try and redeem his position."

Mr. Lister has many interesting stories to tell of the disturbances which took place between the English and Irish labourers. He remembered well how to divide the two parties. Stephenson called the Irish together, and told them if they would follow him he would give them protection.

TECHNOLOGY IN MANCHESTER.

tion committee and the Council of the University, came up for consideration at the meeting of the Manchester education committee on Tuesday. The report of the sub-committee stated that the Council of the University is prepared to recommend the establishment of a faculty of technology on certain conditions. The first members of the Board of the faculty are to be the present members of the Board of Studies of the school of technology engaged in the teaching of mathematics as applied to technical subjects, mechanical engineering, electrical engineering, sanitary engineering, applied chemistry, applied physics, architecture and building construction, technology of fibres and their subsequent treatment, and mining; the Vice-Chancellor and five members nominated by the Senate, and the principal of the Municipal School of Technology, who will be recommended to the court for appointment as first dean of the faculty and as a member of the Senate. In the first instance Dr. J. T. Nicolson, Mr. W. J. Pope and Mr. A. Schwartz are under the scheme to be professors of the University and members of the Senate so long as they hold their present appointments in the School of Technology. It is suggested that their titles should be respectively professor of mechanical engineering, professor of applied chemistry and professor of electrical engineering, unless some other suitable titles are agreed upon. The principal of the Municipal School of Technology is to be an officer of the University and dean of the faculty of technology, with a seat on the Senate, "provided that the procedure as to his appointment be that set forth in clause 8." Clause 8 is as follows:—"In the case of a vacancy in the principalship of the Municipal School of Technology and any University professorship or lectureship, the stipend of which is paid by the education committee, the following procedure shall be adopted:—(a) The Senate of the University and the education committee shall each appoint a committee of recommendation; the two committees shall meet and jointly discuss the claims of the candidates. (b) The committee shall report, either jointly or separately, and such report or reports shall be submitted to the Senate and the education committee respectively, and both these bodies shall report separately to the University Council. (c) The University Council shall make the appointment to the professorship or

lectureship in the University, but such appointment shall not come into effect until the City Council have expressed their concurrence.

A NOVEL CONTRACT IN BUENOS AYRES.

A VERY interesting and unusual piece of architectural work, one which might have been planned equally well by Penelope or Sisyphus, says the *American Architect*, has recently been carried out in a South American city with such ingenuity and cleverness that, unless the work may actually have been carried out by North American contractors, the Chilenos are in some danger of having wrested from them by the inhabitants of the Argentine Republic their sobriquet of "the Yankees of South America." The Casino on the Rua Maipu at Buenos Ayres was the scene of operations, and the problem presented for solution was nothing less than its entire reconstruction and considerable enlargement without occasioning the slightest break in the continuity of the nightly theatrical representations. As the change in plan of the stage and auditorium involved not only a certain enlargement but a considerable change in orientation, the main axis being revolved through 45 degs., it can be seen that the building operations, which involved galleries as well as the parquet, must not only have been of considerable extent, but occasioned situations where most contractors would have been glad to leave scaffolding undisturbed for days at a time. Actually, however, all building operations in the auditorium and stage had to stop at about three o'clock in the afternoon, the time between that hour and the rising of the curtain each evening being needed for the replacing of chairs, stalls, boxes, carpets and hangings, and the strengthening of all walls and supports, so as to be able to pass the official examination of the building inspectors, who each night gave a written permit for the use of the building as a theatre for that one night. As the building was entirely rebuilt inside and out, of course much of the exterior work could go on uninterruptedly through the usual working hours, but so far as the auditorium and most of the internal work was concerned, the hours between

midnight and two o'clock the following afternoon had to suffice.

That work of such extent—the building since its enlargement has contained audiences of 4,000 persons—could be done at all under such unusual conditions, was made possible by the most precise of plannings and the most skilful of execution, and only then because of the present advanced condition of the art of metal construction and the possibility of bringing framework, and so on, to the job in unusually short sections that required a minimum of field-work in their installation. As the climate is not severe in Buenos Ayres and the building is often used for hippic performances of one kind or another, the roof over the auditorium is made to roll forward over the flat roof of the front portion of the building, thus opening the auditorium to full air. This movable roof and its electric installation were made in the United States. The floor of the parquet is centrally supported on pivoted bascule trusses, and this makes it possible to incline the floor towards the stage and place thereon the chairs *en gredin* in ordinary theatre fashion, or tilt the floor up to a level, so that after the chairs are removed it may afford a good dancing-floor for public balls. As the circus-ring is below the level of this tilting floor, it is necessary to dismantle and remove the whole structure whenever equestrian performances, horse-shows and so on are to take place; at such times the seating capacity lost in the parquet is more than made good by the now uncovered seats in the basement that surround the ring. The architect and contractor clever enough to conceive and carry out this interesting piece of alteration were MM. Charles Séguin and A. Prunières.

THE PONTINE MARSHES.

ON the fringe of the Pontine Marshes, that historic swamp which consuls, emperors and popes in vain endeavoured to drain, there lies, says Mr. William Miller in the *Morning Post*, a deserted city, a Mediæval Pompeii. The slow train, which winds round the spurs of the Volscian Mountains on its way to Terracina and the Latin shore, pulls up on the margin of a lake, resonant with the hoarse croaking of hundreds of Pontine frogs, and in five minutes we are within the magic circuit of the ivy-grown walls of Ninfa. A

tall tower, once the proud creation of Cardinal Peter Gaetani, nephew of the great Pope Boniface VIII., guards the entrance to the abandoned town, whose sole inhabitants are the butterflies and the lizards and the frogs. A few children and a woman, gaunt with fever, the product of the marshes, come here by day to work at a mill, but no one sleeps within the ruined Mediæval fortress.

Yet here was once a flourishing little community. On one of the deserted churches we could still see the frescoes of saints, painted by some long forgotten artist, and the long trails of the clematis cover houses once inhabited by the vassals of the ancient Pontine family of the Gaetani, whose chief still owns the great castle of Sermoneta on the hill yonder. A broken bridge half spans a rapid stream, which intersects the deserted town, and the Mediæval streets and the old market-place have long since disappeared beneath a thick growth of luxuriant weeds, which flourish in the marshy soil. Here some novelist might lay the scene of a stirring romance in the dim twilight of the Middle Ages; indeed, a legend tells of a fair damsel who threw herself, for the sake of her lover, from the Gaetani tower into the silent lake below. Yet there was a time when Ninfa, now so picturesquely desolate, figured largely in parchment deeds, and was bought and sold as a valuable asset. Far back, in the spacious Byzantine days, when Rome was an annexe of Constantinople, and the Imperial Exarch still lingered on at Ravenna, the iconoclast Emperor Constantine, he of the unsavoury nickname, granted Ninfa, and with it lofty Norma, which rises high above us on the mountain-side, to the sainted Pope Zacharias to be part of the Papal patrimony, and here, within one of these roofless churches, a later pope, Alexander III., the successor of our only English pontiff, and the mightiest adversary of Barbarossa, was consecrated with all the ceremonies of the Mediæval hierarchy.

But the golden age of Ninfa was the close of the thirteenth century, when the Gaetani began to consolidate their little Pontine kingdom under the auspices of their great kinsman, Boniface VIII. In those days Cardinal Peter paid in hard cash some 94,000*l.* of our money for the undivided possession of the township of Ninfa, and received it from his Papal uncle as a fief for ever on condition that he should never alienate one single stone of it to the hated

Colonna. It was then, too, that Boniface himself bought lofty Norma for 12,000*l.*, so that the Gaetani scutcheon might be seen on all the towns of the Marshes.

But fever was stronger than popes or cardinals. Gradually the deadly disease of the marshes crept over the dwellers by the lake of Ninfa. To-day the station master and his family are the sole denizens of that low-lying ground, and for four months every summer they too reside up at Norma, and Ninfa is left without a living soul. Here at last is a place which modern Italy cannot "improve" out of its picturesque existence.

It is strange to find one of our countrymen in this unfrequented region. The stationmaster at Ninfa, at whose house we passed the night, had much to tell of the British abbot of an adjoining monastery, a man beloved by the whole countryside. Early next morning we attended service in this picturesque abbey church, one of whose windows commemorates the safe return of a Gaetani from the great struggle between the Cross and the Crescent in the waters of Lepanto. Dogs and babies ran about the floor of the spacious building, while the peasants in their costumes knelt reverently at their devotions. Here, at any rate, the populace had much for which to bless the Government of the Popes. The fine bridge which leads to the abbey, the splendid road which leads in huge serpentines up to Norma, were the work of Pius IX., while the one man of modern times who has seriously grappled with the problem of the Pontine Marshes was Pius VI., the martyr of the Modern Papacy, whose name should go down to history in this region with that of Appius, the builder of the Pontine road, whose huge blocks we traverse outside Terracina, just as did Horace on that memorable journey to Brindisi and as did St. Paul on his still more famous journey to Rome.

Terracina still stands, as it stood in Horace's time, on the white limestone cliff, which shows above the dull level of the vast plain. At the foot of the rock a colony of herdsmen and their families from Trella, in the Abruzzi, have settled for the winter in conical huts of straw, like the Koutso-Wallachs whom one sees in Boeotia. The people of Trella are of Saracenic origin, and the women show their Oriental ancestry in the costume which they still wear—the white head-dress, on which the picturesque pitchers of copper or earthenware are so deftly poised, the braces and

the dark cloth fastened over the skirt. Seldom in modern Italy, amidst the sartorial abominations of the slop-shop, does one see so much costume as here. But Terracina, despite the ugly modern town which has grown up near the sea, preserves in the tortuous streets of the rock-city all the attributes of the Middle Ages. The quaint beasts which support the outer pillars of the fine cathedral must have listened to the reading of the quaint charter of Pius II., who allowed the Jews to live at Terracina "because of the necessity which the citizens have of borrowing money." The town walls contain blocks of stone which withstood many a Papal siege, and if recent excavations have cruelly dislodged the ghost of the great Theodoric from the vast ruins on the promontory above the town, his memory is preserved in the name of the local theatre and in those of many a local tradesman. But here the climate and the natural surroundings are rather Greek than Italian. Terracina was, indeed, once a Greek city, and in the asphodel meadow above the town the traveller might easily imagine that he was in one of those Homeric scenes which are so common in the islands of the Ionian Sea.

But we have not far to go from Terracina in order to get upon the track of the Homeric hero. A drive of ten miles over the plain and among the smouldering fires of the charcoal burners takes us to the foot of the enchantress Circe's fabled home, now no longer an island though it seems so from afar. Among the herds of black pigs which thrive on the mountain there may be descendants of the unhappy mortals whom the cunning witch converted into animals, and her name still lingers on in that of this lofty and isolated rock—Monte Circeo.

There is nowadays a greater air of prosperity about Terracina and its neighbourhood than might have been expected. Living is cheap there; fish, fruit and vegetables are abundant, and the people seem to live well. Certainly they are not tempted by the distractions of the capital; for there are few who care to take the five hours' journey to Rome behind one of the "coffee-pots," as they call the engines, which pant laboriously along the railway at a speed of fifteen miles an hour. Amid the orange groves and the lemon gardens of this old Volscian town men can cultivate that equanimity which Horace declared would secure happiness even in the depths of the Pontine Marshes.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE
TO THE
ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.

Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of MESSRS. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders

and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

MAY-OATWAY FIRE ALARM. WHAT USERS SAY.

Messrs. J. Thomasson & Sons, Spinners, of Bolton write:—"A small fire occurred on our premises. The May-Oatway Alarm worked satisfactorily. 10 minutes before the Automatic Sprinkler went off." Loss £48. What have you done to limit your loss?

Messrs. S. Henderson & Sons, Ltd., Biscuit Works, Edinburgh, write:—"A fire broke out in our factory during the dinner hour on January 18, 1905, when the May-Oatway installation (put in since our previous fire) saved a very serious loss. We now have a pleasing sense of security in having an automatic system which not only gives immediate warning to our own staff, but calls the Fire Brigade as well." Loss under £50.

MAY-OATWAY FIRE ALARM.—Rt. Hon. Richard Seddon, P.C., Premier, writes:—"This system has been largely adopted in New Zealand, and has given the greatest satisfaction." (The Government are the largest users; protecting Schools, Asylums, &c.)

Mr. H. Jenkinson, Printer, Leeds, writes:—"Fire March 16 and December 12. Both instantly signalled to Fire Station by the May-Oatway Fire Alarm, and resulting in comparatively little loss." Claims paid, £10 and £80 respectively. What have you done to limit your loss?

Send for circular, or call and inspect 94 Paul Street, E.C.; Glasgow, Liverpool and Manchester.

TENDERS.

BRIGG.

WAPLER'S VENETIAN BLINDS

Are fitted with a very simple and effective Check Action. (OWN PATENT.)

Are very light and elegant in consequence of the laths being extra thin. Are as easily worked and taken down as ordinary roller blinds. There is nothing to get out of order. The wear on tapes and cords reduced to a minimum.

For all our Venetian Blinds we use only the very best selected Pine.

TRADE NOTES.

THE Isolation Hospital, Ealing, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke-flues, Manchester grates, exhaust roof and inlet ventilators.

We have much pleasure in announcing that the firm of C. W. Waters & Co., of Great Eastern Street, London, has been converted into a limited liability company. All the trade creditors of the late firm have been paid in full, and the business will be carried on under the old name of C. W. Waters & Co., Ltd. In consequence of a steadily increasing business new works are being equipped, and will shortly be opened at Brimsdown.

CITY AND GUILDS OF LONDON INSTITUTE'S
DEPARTMENT OF TECHNOLOGY.

ON Wednesday last an exhibition was opened by Earl Spencer at the Imperial Institute of practical work executed by students of technological classes in Great Britain, Ireland and the Colonies, and by candidates at the City and Guilds of London Institute's annual examinations, 1905. The specimens of workmanship, which are of a very creditable character taken altogether, are arranged along the North Gallery at the Imperial Institute, and will remain open for inspection up to and including July 8. They comprise examples of road engineering, mechanical engineering and building designs, metalwork, carriage building, manual training, plasterers' work, carpentry and joinery, cabinet-making, plumbers' work, painters' and decorators' work, besides goldsmiths' and silversmiths' work, &c.

From the report which was read on the occasion, referred to by Sir Philip Magnus, the superintendent, we gather that the present exhibition of students' work is the seventh which has been held by the City and Guilds of London Institute, and while in 1881, the year after its incorporation, there were but 2,500 students in attendance at the evening classes and 1,563 candidates came up for examination, this year there have been 44,099 students in attendance and the number of candidates has increased to 20,923. The number of separate subjects in which classes were held in 1881 was twenty-three only, whilst at the recent examination candidates presented themselves in sixty-seven branches of trade. It is also interesting to note that 1,127 candidates were recently entered for the examinations for the teacher's certificate—1,015 in woodwork and 112 in metalwork. Specimens of their work are among the exhibits on view.

BUILDING AND BUILDERS.

MR. ARTHUR STRATTON, A.R.I.B.A., architect, has removed to 16 Hart Street, Bloomsbury Square, London, W.C.

MR. JOHN C. STOCKDALE, architect, has removed to 16 Hart Street, Bloomsbury Square, London, W.C.

THE North British Railway Company have authorised the erection of a new station at Berwick at a total cost of over 50,000*l*.

NEW insurance offices in the Gothic style have been erected in Dale Street, Liverpool, from the designs of Mr. Aubrey Thomas. The furnishing and decoration are by Messrs. Waring & Gillow, Ltd.

MR. CHARLES A. WALKER, a well-known Preston contractor, died on Tuesday at fifty years of age. His firm is the oldest firm of builders in Preston, and many important contracts have been carried out by it. He was president of the Master Builders' Association.

A CONFERENCE between representatives of the Edinburgh, Leith and District Building Employers' Association and the operative joiners on strike took place on the 23rd inst. on the initiative of the Lord Provost. The proceedings lasted nearly six hours.

At the last meeting of the Glasgow Town Council a letter was read from the Trades Council drawing attention to the delay in completing Corporation contracts, on account of the present dispute between the private building employers and their workmen. The letter concluded with a request that the Corporation should receive a deputation on the question. The Council agreed to hear the deputation.

THE National Lime Manufacturers' Association, U.S.A., offer two prizes, one of 100 dollars for the best paper and the other of 50 dollars for the second paper on the subject of lime *v*. plaster. It is desired in these papers to present the best truthful arguments in favour of the use of lime, either directly as a lime-plastering mortar, or indirectly by its use in large quantities in a hydrated form in prepared plasters.

THE Yorkshire Federation of Master Builders held their monthly meeting on the 23rd inst. At the conclusion of the business Mr. J. Biggin was presented with a carved oak timepiece, with Westminster chimes, a gold snuff-box and

an illuminated address from the members of the Sheffield Association, as a token of their regard and esteem for his many years of useful work in connection with the organisation.

BUILDING operations in Portsmouth are becoming extremely active. A week ago the roads and works committee passed a large number of plans for houses which it is proposed to erect, and at the meeting of the same committee on Monday another exceptionally large batch of plans was approved. Altogether plans for the large number of eighty-two houses were passed.

FORTY years ago, says the *Manchester Guardian*, a young man went up from Gloucestershire to be clerk of the works at the rebuilding of Hawsker Church, between Robin Hood's Bay and Whitby, and, so far from home, he fell ill and died. They buried him in Hawsker churchyard, and the masons whom he had directed set a stone over his grave and cut upon it the inscription, "Study to be quiet and mind your own business."

A MEETING of the Essex education committee was held on the 26th inst., when the county architect reported having found the Leigh-on-Sea National school in such an unsatisfactory state that it was advisable to vacate it at once. The school is built on the face of a steep hill, and there were signs that the school was gradually sliding down the hill, though there was no immediate danger of a sudden rush. It was agreed to close the school and to erect a temporary building, and eventually a new school, on other ground.

ARRANGEMENTS are being made for holding the next course of advanced instruction for plumbers at King's College, London, in August and September next, under the auspices of the Plumbers' Company and several of the county and municipal educational authorities. Plumbing teachers and advanced students desirous of availing themselves of the facilities provided should apply as early as possible to the educational authority of the town or county in which they reside for the requisite grant or scholarship to enable them to attend.

UNDER the auspices of the Workmen's National Housing Council a Lancashire and Cheshire conference was held at Manchester on the 24th inst. to discuss the housing problem. More than 150 labour organisations were re-

presented. A resolution was agreed to complaining of excessive rents and overcrowding in insanitary dwellings, and declaring that the result was physical and moral deterioration and abnormal disease and death rates. The resolution also appealed to the organised workers to earnestly grapple with the housing difficulty by inducing trades unions and co-operative societies to invest their funds in the provision of good houses for their members, and, above all, by bringing pressure to bear upon the local authorities so that the securing to every family the necessary amount of healthy house accommodation should not be left to chance or private enterprise, but should be accepted as the responsibility of the community.

ELECTRIC NOTES.

ELECTRICAL installations are being provided in the larger cantonments in the plains of India, where the hot weather is of long duration.

THE net profit on the working of the Glasgow municipal tramways for the year is 93,257*l.*, of which 68,000*l.* is to be written off for special depreciation and the balance carried to reserve.

THE Board of Trade have sanctioned the borrowing by the Heywood Corporation of 37,200*l.* for electrifying the tramways within the borough and the extension of the electricity works.

THE Corporation of South Shields propose to extend its electricity works at a cost of 15,625*l.* Additional plant is to be installed in the power station, so as to provide electrical energy for the tramways, and also for supplying current to factories and workshops. An official inquiry has been held.

THE Incorporated Municipal Electrical Association are seeking the support of local authorities owning electrical undertakings to the electrical exhibition to be held in London in the autumn under the auspices of the National Electrical Manufacturers' Association.

THE Dundee Town Council have reduced the price of gas from 2*s.* 10*d.* to 2*s.* 8*d.* per 1,000 feet, and electricity will be charged for at 4*d.* per unit after twenty units and

3*d.* per unit consumed above 10,000 units. Electrical energy is to be supplied to the tramways at 1½*d.* per unit.

THE Liverpool Select Vestry have decided to entrust the preparation of plans and specifications for the proposed electrical generating station at Brownlow Hill to a certain firm of electrical engineers. The Local Government Board have provisionally authorised the erection of a station at a cost not exceeding 10,000*l.*

IN connection with the installation of electricity at Portsmouth, it has been decided to supply Whale Island with current from the new generating station to be erected in the dockyard, in preference to erecting a power station on the island itself. In this way a considerable saving will be effected.

THE Chicago and Alton Railway Company, U.S.A., have announced that arrangements have been completed for installing wireless telegraph system on all trains running between Chicago and St. Louis. Eventually the trains will be in wireless communication with the larger cities. In the course of preliminary experiments messages were received by a train travelling at a speed of fifty miles an hour.

Fears for the beauty of the Falls of Niagara on the score of the construction of the Canadian power works have proved groundless. The river portion of the works was completed last week, and when the temporary obstructions necessary for the construction had been removed it was found that the water resumed its natural course and the falls are quite uninjured.

THE Court of Common Council have considered a report from the electrical engineer relative to the leakage of electricity from the consumers' lines in cellars under the public ways, and the possible danger of shocks to the public therefrom. The streets committee recommended that the attention of householders should be drawn to the necessity of fixing and maintaining their electric circuits and apparatus in such a manner and condition as to prevent the possibility of the pavements from becoming charged with electricity.

THE Associazione degli Industriali d'Italia, No. 61 Foro Bonaparte, Milan, Italy, invite investors to compete for two prizes offered by it, as follows:—First prize, 1,600 dols. and a gold medal, for a new method to prevent danger

which may arise from the contact of high tension with low tension winding of electric rotary-current transformers; second prize, 100 dols. and a gold medal, for a simple, strong and reliable safety device for stopping cars running on an inclined plane in case of the breaking of the wire cable. The device must be capable of adjustment to ordinary cable roads now in use.

THE Bowhill Coal Company, whose average daily output is 2,000 tons, are introducing a new electric-power installation at their colliery, and also intend to light the village of Bowhill, N.B., by means of electricity. The engine is a powerful one—slow speed, compound, high-pressure and low-pressure cylinders, of 500 horse-power, and with ninety revolutions per minute. The high-pressure cylinder is 22½ inches and the low-pressure cylinder 33 inches, while the stroke is 42 inches. The engine drives a three-phase alternator, which generates the power by fourteen ropes instead of belting. The latter machine is 600 horse-power. The utilisation of the power will be wholly underground. A lighting plant is on order, and it is proposed to illumine the pit bottom with electricity, and also the streets of Bowhill.

THE Administrative County of London Electric Power Bill, which seeks power to supply an extensive area with electrical energy at a cost of about 6,000,000*l.*, and which was passed by a select committee of the House of Lords after a protracted hearing, came before the Examiners of Private Bills of the House of Commons on the 22nd inst. for the investigation of standing order proofs. The Bill was opposed by the South Metropolitan Gas Company on the ground that sufficient notice had not been given, "the Bill having had certain amendments made in the House of Lords." The examiners decided that the *London Gazette* and newspaper notices were insufficient, and they therefore reported a non-compliance. The standing orders committee, after considering the matter, decided to dispense with the standing orders, and the Bill will accordingly be allowed to proceed.

THE Dublin Corporation have adopted the following arrangement with Mr. Robert Hammond, the electrical engineer, with reference to the termination of his original agreement:—Mr. Hammond, in consideration of the under-

takings on the part of the Corporation, should release the Corporation from any liability under the agreement of November 1899, to employ or remunerate him in connection with any electric or other works or extensions of the Corporation electric supply system, save and except the works at present in hand and nearing completion under his supervision; but that nevertheless Mr. Hammond shall be bound to see that the works at present in hand or carried out under his supervision, and the contracts in connection with same, are efficiently completed in a proper and workmanlike manner, in accordance with the said recited agreement, and give all necessary assistance and information in laying the accounts connected with the said scheme, and justifying same before the Local Government Board auditor, without any additional fee beyond that set forth in the hereinbefore recited agreement, and the Corporation agree from and after the ratification of this agreement to pay the out-of-pocket travelling and hotel expenses of Mr. Hammond, or any member of his firm whilst engaged instead of him, after June 1, 1905, on the remaining work to be performed by him under the agreement of 1899, as hereby modified.

VARIETIES.

THE Newcastle Corporation loan of 300,000*l.* was subscribed more than four times over, the actual amount offered being 1,165,669*l.*

In view of the already large number of makers of cement block machinery in America, a conference was arranged for June 27 and 28 for the purpose of forming an association.

THE London Corporation have adopted the report of a special committee which we mentioned last week, approving the proposal to widen Blackfriars Bridge or build another bridge, with a view to the linking of the north and south sides of the Thames by electric tramways.

THE Manchester baths and washhouses committee have appointed a special sub-committee to inquire into the expenditure on the Victoria baths, High Street, Chorlton-on-Medlock, in accordance with the decision come to by the City Council, when it was shown that the original estimate for the baths had been exceeded by some 20,000*l.*

THE OWNER of No. 13 Glebe Road, Hornsey, altered the number to 11A, and the borough council objected. It was then argued by the owner that "there was a difficulty in letting a house numbered 13." The Council now informs the owner "that the alteration cannot be allowed, and that he is required to reinstate the old number."

A PARTY of between sixty and seventy advanced engineering students of the Glamorgan County Council's classes left Cardiff on Monday for a tour around the engineering districts of Manchester and Leeds, returning from the latter city on the following Saturday. The party is in charge of Mr. Arthur Cryer, county engineering lecturer.

AT THE Women's Institute a paper by Miss McClelland was read last week entitled "A Cottage for 150/," and was descriptive of a cottage designed by her for the Garden City Competition at Hitchin. The cottage contains a sitting-room and scullery (with bath) on the ground floor and three bedrooms on the upper storey.

THE members of the Canadian Manufacturers' Association visited on Saturday the works of the Associated Portland Cement Manufacturers (1900), Limited, at Northfleet. The Hon. J. B. Holland assured the cement manufacturers that they might go on increasing their works, as the use of cement in Canada was unlimited.

THE Fulham Board of Guardians have decided by a large majority to replace the infirmary heating apparatus by a low-pressure system in which all exhaust steam will be utilised. Messrs. F. H. Medhurst & Lloyd, whose recommendations have been adopted, have been appointed to prepare the necessary specifications for the work, the cost of which is estimated at about 4,000/.

THE county borough of Salford have announced to builders, contractors and others that plans in duplicate for temporary stands or balconies of any description in connection with the proposed royal visit must be submitted to the borough engineer, town hall, Salford, and the sanction of the Corporation obtained before such structures are commenced.

A LOCAL GOVERNMENT BOARD inquiry has been held at Preston into the application of the Corporation for power to borrow 20,000/ for the erection of an infectious diseases hospital in Holme Stack Lane on part of the Corporation

estate. It was stated that a tender of 19,382/ had been provisionally accepted, the cost per bed working out at 346/.

THE sub-committee of the Scottish National Exhibition, 1907, have reported that satisfactory progress was being made with the guarantee fund, and that a number of subscriptions have been received within the last few days, including 1,000/ from a large manufacturing firm in the city. Several applications for space were intimated, one applicant offering 200/ for the space required.

CAPTAIN MARLIN STUART, who was injured during the construction of the New York subway in 1902 and had in consequence to resign his commission in the British Navy, has lost his suit for 75,000 dols. damages against the Subway Construction Company and the Interborough Rapid Transit Company. While the captain was at an hotel he was injured by an explosion of dynamite caused by the construction company, and his injuries brought about nervous prostration.

AT Partick Dean of Guild Court the Glasgow Corporation—the local authority—last week sought permission to erect a new foreign animals wharf, with lairages and slaughter-house accommodation, on Merkland grounds, Whiteinch. The estimated cost of the scheme is 100,000/. As the Glasgow Corporation had omitted to get the formal sanction of the local Town Council for the erection of a slaughter-house, the case was continued to permit of this being done.

It is definitely announced that the Irish International Exhibition will be opened during May 1907 in the Herbert Park, Balls Bridge, Dublin. It was originally intended to hold this exhibition in 1906, but it has been found necessary to alter the date. The site is within a mile and a half of the centre of the city, and easily accessible by three lines of tramway which will connect the grounds with the various railway termini. The guarantee fund has almost reached 150,000/.

THERE is now in use in America a new railway track-layer which, with a crew of forty men, will lay two miles of track a day. The track-layer has a huge crane 60 feet long, which projects forward over the road, and hauls behind it a train of sixteen flat cars loaded with ties and rails. A continuous double line of cars moves constantly

over rollers and carries the ties with it. Both rails and ties are seized at the proper time by the machinery and placed on the road in front of the train, where they shortly form part of the track over which it passes.

THE Handsworth District Council's education committee in a recent report stated that they adhered to the Plenum system of ventilation for the Rookery Road and Westminster Road schools. In the discussion by the Council it was moved that the report be again referred back to the committee, with instructions to adopt the natural system of ventilation. On a vote being taken, the committee's report was approved in favour of the Plenum system.

At Sheffield last week a firm of spring makers answered a summons by the Corporation which alleged that they had disobeyed an order to abate a smoke nuisance, but the case was not heard because the magistrates on the bench, themselves cutlery manufacturers, declined to adjudicate. The case was taken first to the second court, and when it had been called on the chairman said, "You had better take it to the other court; you will not get any sympathy from me." The chairman of the first court similarly declined to hear the summons.

THE Walsall Town Council have adopted the report of a committee showing that, owing to variations in the contract and extra works carried out, the cost of the new municipal buildings would be at least 100,000*l.*, and recommending that application be made to the Local Government Board for sanction to the Council borrowing 25,000*l.* in addition to the 75,000*l.* authorised by the Walsall Corporation Act of 1900, and that, if any further sum was required, it be provided out of the amount received under the financial adjustment with the County Council.

The Scottish steel and iron manufacturers have considered the draft regulations proposed to be made by the Secretary of State under Section 79 of the Factory and Workshops Act, 1901, for the use of locomotives and waggons on lines and sidings in or used in connection with premises under this Act. Some of the chief points to which exception are taken are that there shall be a 4 feet clear space between each line of rails, that no material is to be deposited within 3 feet of the lines of rails and the provision of permanent crossings.

A NEW 100-ton electrically-worked revolving crane has been installed in the Dublin Docks at North Wall. Preparations were begun last year by driving into the ground 110 piles to a depth of between 30 and 40 feet. Over these was laid the foundation, consisting of 3,500 tons of concrete, and on this the superstructure was reared to a height of 77 feet. On Saturday the crane was tested with a weight of 150 tons of steel rails, which was raised to a height of 70 feet above the quay, swung around and traversed in and out along the great arm or girder overhead.

THE arbitration between the Humber Conservancy and the Hull Dock joint committee as to the price to be paid for the acquisition by the latter of 147 acres of foreshore at Marfleet, for the purposes of dock extension, was concluded on the 16th inst. before Sir John Rolleston, sitting as umpire, and Mr. Gott (Bradford) and Mr. E. Fowler (Sheffield) as arbitrators. The owners of the land on the last day claimed 200*l.* an acre as the value of the foreshore. Witnesses for the joint committee contended that the valuation should be one-sixth the value of the land behind it, *i.e.* 50*l.* an acre. The award was deferred.

In the supplement of the *African World*, June 3, there is a description of the salving of the *Maine*. The vessel arrived at Durban on February 20, seriously damaged, with leak gaining rapidly on the pumps. As it was essential that extra pumps should be put to work in the least possible time, a 5-inch Pulsometer was fixed in No. 1 hold and set to work within three or four hours. A larger centrifugal pump was brought on board, but it took ten hours to get this to work. As the above-mentioned paper states, "it will be seen how a 5-inch Pulsometer managed to keep that huge vessel afloat for nineteen hours until other and heavier pumps could be fixed and set to work." The tonnage of the *Maine* is 7,924 tons gross. The statement above suggests the value of a pump like the Pulsometer, which can be quickly fixed in cases of emergency.

SIR BENJAMIN BAKER has made his inspection of Union Bridge, Aberdeen, which it is proposed to widen from 40 feet to 60 feet. He had previously expressed doubts as to the advisability of widening the bridge by means of additional granite masonry, lest the driving of fresh piles

GILBERT WOOD & CO. Ltd., Imperial Buildings, Ludgate Circus, E.C.

might disturb the foundations of the bridge, and he suggested as an alternative scheme the erection of iron girders on either side to carry additional foot pavements. As a result of his examination Sir Benjamin expressed himself as thoroughly satisfied with the stability of the existing structure, and better pleased with the foundations than he had expected to be. The foundation at the south-west corner is especially satisfactory, as it has a rock basis. The prospect of granite now being used in the widening of the bridge has given great local satisfaction.

MANCETTER MANOR, Warwickshire, has just changed owners through the agency of Messrs. Tresidder & Co., of Cockspur Street, London. Mancetter was the Manduesedum of the Romans, concerning which Dugdale, in his "History of Warwickshire," gives many interesting particulars. It was given by William the Conqueror to Hugh Lupus, Earl of Chester, and passed from him to Walkeline de Mancetter, who built the fine adjacent church. His descendant, Edmund de Mancetter, died in the reign of Edward III. without issue, bequeathing it to a relative, who married Thomas Harper, who sold it to John Glover, of Baxterly. Robert Glover, the Protestant, who resided many years at the manor-house, was taken away from it to Coventry, and there burnt in 1555. The present residence is a well-preserved and characteristic specimen of an early Warwickshire manor-house, still retaining exceptionally fine hand-worked oak beams, panellings and wide open fireplaces; probably few better specimens of its age remain in the country. The grounds, extending to some 12 acres, also have an interest of their own.

A SETTLEMENT has been effected in the dispute which arose twelve weeks ago at Mungall Foundry, Carron Iron Works, Carron. The cause of the strike of 200 moulders was the imposition of a fine of $\frac{1}{2}d.$ on every pound over the standard weight of the article cast. The men alleged that they could not cast the standard weight with the patterns provided, as these, they stated, were defective. A settlement was arranged on the 20th inst. The terms were that improved plant would be provided; that a fine of $\frac{1}{4}d.$ would be exacted where the excess weight was due to the fault of the worker, or, alternatively, the casting would be condemned, and that the basis of average work would be ex-

tended from one day's work to a week's work. These were the terms of the company, the men having asked that notice of a fine be withdrawn, the plant renewed, and the question of overweight left undecided until a reasonable time after the resumption of work. The company's terms were accepted by the men's representatives, but, on being communicated to the workers on the following day, they were through some misunderstanding refused, and the strikers declined to resume work on the day agreed upon. Another meeting of the representatives was held on the 22nd inst., and the misunderstanding was cleared away and work will be resumed.

DUNDEE CITY CHURCHES.

A REPORT on the repair and restoration of Dundee city churches—St. Mary's, St. Paul's and St. Clement's—has been submitted to the Town Council by the city architect. It suggested three schemes—one by removing and repairing only the parts of masonry which are loose and dangerous on the three churches, and pointing St. Clement's, which is estimated to cost 550*l.*; another to clean and dress down the whole masonry and make up with cement instead of stone, at cost of 2,800*l.*; and a third by treating the subject as one of thorough repair or restoration, which is estimated to cost 7,500*l.* It is pointed out that by the first scheme safety would be secured, although the architectural effect of the fabric would be seriously impaired, whereas by the other methods the buildings, with the exception of St. Clement's Church, would be brought back to their original appearance and all the features of the buildings reproduced. The sub-committee felt that while the Town Council might be willing to go considerably beyond their legal obligations and spend a large sum in endeavouring to thoroughly repair the churches in a manner creditable to the city, they could not face an expenditure of 7,500*l.* The general feeling seemed to incline towards adhering to the legal liability of the town, which would be met by the second scheme. It was stated, however, that if the general public and the churches interested co-operated with the Council in restoration of the churches the Council might be prepared to spend a sum of 5,000*l.*, spread over a period of years.

LIGHTNING CONDUCTORS

IN

PATENT COPPER ROPE OR TAPE.

NEWALL'S CONDUCTORS

Are the most reliable, most effective, and cheapest offered to the public

Sole Manufacturers of Vyle's Patent (Easily Tested) Lightning Conductors.

Fixed complete by experienced workmen, and their efficiency tested by competent electricians.

Telephone 601 and 602 Avenue.

"RAPID TRAVEL IN LUXURY."

THESE words appear on the cover of the time table issued by the Great Central Railway Company for July, August and September, and a perusal of its contents demonstrates that this enterprising company intends to justify the use of such a phrase. Many important accelerations have been made in the train service affecting all parts of the country. The express train known as the Sheffield Express, leaving Marylebone at 3.25 P.M., will cover the 164½ miles to Sheffield without a stop in 170 minutes, an average speed of 58.14 miles per hour. For 126½ miles of the journey the speed will average 63 miles per hour. To Leicester the journey of 103 miles will be completed in 104 minutes, and to Nottingham, a distance of 126 miles will be run in 134 minutes. Between London and Manchester the journey will be completed in 3 hours 50 minutes, Halifax in 4 hours 13 minutes, Bradford in 4 hours 30 minutes, Harrogate in 4 hours 35 minutes, and York in 4 hours 10 minutes.

The train service between London (Marylebone) and Stratford-on-Avon offers the quickest and most convenient route.

Commencing July 8, through tourist express trains to York, Bridlington, Scarborough and North-East Coast will leave Marylebone at 10 A.M. and 12.15 P.M.

All express trains are vestibuled and have a buffet car attached, available for first and third-class passengers.

The through service between Newcastle, York, Bradford, Huddersfield, Sheffield and Southampton, Bournemouth, &c., has been considerably improved, and commencing July 10 through express trains will be run between Southampton and Scarborough by the direct route *via* Banbury and Oxford.

In connection with the Great Western Railway the Great Central run through tourist expresses between Leeds, Halifax, Huddersfield, Sheffield, Nottingham, Leicester and Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth and the Cornish Riviera *via* Banbury and Oxford.

THE directors of the Patent Victoria Stone Company, Limited, have declared an interim dividend at the rate of 10 per cent. per annum (being 5 per cent. for the half-year ending June 30).

BUILDING BY-LAWS.

EVIDENCE was given by Mr. Justice Grantham on Tuesday before a committee of the House of Lords on the provisions of the Public Health Acts Amendment Bill, the object of which is to remove some of the difficulties and causes of friction in the administration of building by-laws without impairing their efficiency. The measure is designed to facilitate the erection of cottages and small houses, especially in country towns and rural districts, where the want of accommodation for workmen is acutely felt, and at the same time to free other houses which have plenty of land round them from unnecessary restrictions imposed by existing building by-laws. Sir William Grantham expressed the opinion that the Bill would be most useful, though he confessed that if he had had the drafting of it he would have been inclined to make it a little more drastic. He submitted that there was no reason, from the point of view either of health or of safety, why cottages should not be built without the intervention of the local authority, except so far as might be necessary to secure compliance with reasonable rules of sanitation. Exemption from the operation of the building by-laws of cottages with sufficient space around them would practically obviate the main difficulty which now beset landowners desirous of providing accommodation for rural labourers. He was in favour of giving power of appeal to the County Council from the order of a rural district council before the order could be enforced or proceedings could be taken. Without such an appeal rural councils could pull down houses and apply to magistrates to inflict fines of a most serious character at their own sweet will. An appeal to the County Council would be an inexpensive proceeding, and the fact of there being such a right of appeal would deter rural councils from attempting to enforce unjust demands. Although the new model by-laws of the Local Government Board were a great improvement on the old by-laws, some parts of them which were retained were quite inapplicable to rural districts. If the model by-laws were still further modified and the necessity of sending in plans to the rural district council were abolished there would not be much wrong with them, but in their present form they undoubtedly restricted building in the country.

NEW PATENT "TRIDENT" COOKING RANGE.

**PERFECT COOKER,
VERY ECONOMICAL,
And by far the
MOST CHEERFUL
OPEN FIRE MADE.**

**Choice Selection of
New Pattern Mantle Registers,
Stove Grates & Interiors,
Well Fires.**
